Single wire CAN transceiver

AU5790

FEATURES

- Supports in-vehicle class B multiplexing via a single bus line with ground return
- 33 kbps CAN bus speed with loading as per J2411
- 83 kbps high-speed transmission mode
- Low RFI due to output waveshaping
- Direct battery operation with protection against load dump, jump start and transients
- Bus terminal protected against short-circuits and transients in the automotive environment
- Built-in loss of ground protection
- Thermal overload protection
- Supports communication between control units even when network in low-power state
- 70 μ A typical power consumption in sleep mode
- 8- and 14-pin small outline packages
- ± 8 kV ESD protection on bus and battery pins

DESCRIPTION

The AU5790 is a line transceiver, primarily intended for in-vehicle multiplex applications. The device provides an interface between a CAN data link controller and a single wire physical bus line. The achievable bus speed is primarily a function of the network time constant and bit timing, e.g., up to 33.3 kbps with a network including 32 bus nodes. The AU5790 provides advanced sleep/wake-up functions to minimize power consumption when a vehicle is parked, while offering the desired control functions of the network at the same time. Fast transfer of larger blocks of data is supported using the high-speed data transmission mode.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT

SO8 PIN CONFIGURATION

SO8 PIN DESCRIPTION

SYM-BOL	PIN	DESCRIPTION
TxD	1	Transmit data input: high = transmitter passive; low = transmitter active
NSTB (Mode 0)	2	Stand-by control: high = normal and high-speed mode; low = sleep and wake-up mode
EN (Mode 1)	3	Enable control: high = normal and wake-up mode; low = sleep and high-speed mode
RxD	4	Receive data output: low = active bus condition detected; float/high = passive bus condition detected
BAT	5	Battery supply input (12 V nom.)
RTH (LOAD)	6	Switched ground pin: pulls the load to ground, except in case the module ground is disconnected
CANH (BUS)	7	Bus line transmit input/output
GND	8	Ground

SO14 PIN CONFIGURATION

SO14 PIN DESCRIPTION

SYM-BOL	PIN	DESCRIPTION
GND	1	Ground
TxD	2	Transmit data input: high = transmitter passive; low = transmitter active
NSTB (Mode 0)	3	Stand-by control: high = normal and high-speed mode; low = sleep and wake-up mode
EN (Mode 1)	4	Enable control: high = normal and wake-up mode; low = sleep and high-speed mode
RxD	5	Receive data output: low = active bus condition detected; float/high = passive bus condition detected
N.C.	6	No connection
GND	7	Ground
GND	8	Ground
N.C.	9	No connection
BAT	10	Battery supply input (12 V nom.)
RTH (LOAD)	11	Switched ground pin: pulls the load to ground, except in case the module ground is disconnected
CANH (BUS)	12	Bus line transmit input/output
N.C.	13	No connection
GND	14	Ground

Single wire CAN transceiver

AU5790

FUNCTIONAL DESCRIPTION

The AU5790 is an integrated line transceiver IC that interfaces a CAN protocol controller to the vehicle's multiplexed bus line. It is primarily intended for automotive "Class B" multiplexing applications in passenger cars using a single wire bus line with ground return. The achievable bit rate is primarily a function of the network time constant and the bit timing parameters. For example, the maximum bus speed is 33 kbps with bus loading as specified in J2411 for a full 32 node bus, while 41.6 kbps is possible with modified bus loading. The AU5790 also supports low-power sleep mode to help meet ignition-off current draw requirements.

The protocol controller feeds the transmit data stream to the transceiver's TxD input. The AU5790 transceiver converts the TxD data input to a bus signal with controlled slew rate and waveshaping to minimize emissions. The bus output signal is transmitted via the CANH in/output, connected to the physical bus line. If TxD is low, then a typical voltage of 4 V is output at the CANH pin. If TxD is high then the CANH output is pulled passive low via the local bus load resistance R_T . To provide protection against a disconnection of the module ground, the resistor R_T is connected to the RTH pin of the AU5790. By providing this switched ground pin, no current can flow from the floating module ground to the bus. The bus receiver detects the data stream on the bus line. The data signal is output at the RxD pin being connected to a CAN controller. The AU5790 provides appropriate filtering to ensure low susceptibility against electromagnetic interference. Further enhancement is possible with applying an external capacitor between CANH and ground potential. The device features low bus output leakage current at power supply failure situations.

If the NSTB and EN control inputs are pulled low or floating, the AU5790 enters a low-power or "sleep" mode. This mode is dedicated to minimizing ignition-off current drain, to enhance system efficiency. In sleep mode, the bus transmit function is disabled, e.g.

the CANH output is inactive even when TxD is pulled low. An internal network active detector monitors the bus for any occurrence of signal edges on the bus line. If such edges are detected, this will be signalled to the CAN controller via the RxD output. Normal transmission mode will be entered again upon a high level being applied to the NSTB and EN control inputs. These signals are typically being provided by a controller device.

Sleeping bus nodes will generally ignore normal communication on the bus. They should be activated using the dedicated wake-up mode. When NSTB is low and EN is high the AU5790 enters wake-up mode i.e. it sends data with an increased signal level. This will result in an activation of other bus nodes being attached to the network.

The AU5790 also provides a high-speed transmission mode supporting bit rates up to 100 kbps. If the NSTB input is pulled high and the EN input is low, then the internal waveshaping function is disabled, i.e. the bus driver is turned on and off as fast as possible to support high-speed transmission of data. Consequently, the EMC performance is degraded in this mode compared to the normal transmission mode. In high-speed transmission mode the AU5790 supports the bus signal levels as specified for the CANH output of the fault-tolerant CAN transceiver TJA1054.

The AU5790 features special robustness at its BAT and CANH pins. Hence the device is well suited for applications in the automotive environment. The BAT input is protected against 45 V load dump and jump start condition. The CANH output is protected against wiring fault conditions, e.g. short circuit to ground or battery voltage, as well as typical automotive transients. In addition, an over-temperature shutdown function with hysteresis is incorporated protecting the device under system fault conditions. In case of the chip temperature reaching the trip point, the AU5790 will latch-off the transmit function. The transmit function is available again after a small decrease of the chip temperature.

Table 1. Control Input Summary

NSTB	EN	TxD	Description	CANH	RxD
0	0	Don't Care	Sleep mode	0 V	float (high)
0	1	Tx-data	Wake-up transmission mode	0 V, 12 V	bus state ¹
1	0	Tx-data	High-speed transmission mode	0 V, 4 V	bus state ¹
1	1	Tx-data	Normal transmission mode	0 V, 4 V	bus state ¹

NOTE:

1. RxD outputs the bus state. If the bus level is below the receiver threshold (i.e., all transmitters passive), then RxD will be floating (i.e., high, considering external pull-up resistance). Otherwise, if the bus level is above the receiver threshold (i.e., at least one transmitter is active), then RxD will be low.

Single wire CAN transceiver

AU5790

ABSOLUTE MAXIMUM RATINGS

According to the IEC 134 Absolute Maximum System: operation is not guaranteed under these conditions; all voltages are referenced to pin 8 (GND); positive currents flow into the IC, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V _{BAT}	Supply voltage	Steady state	−0.3	+27	V
V _{BATId}	Short-term supply voltage	Load dump; ISO7637/1 test pulse 5 (SAE J1113, test pulse 5), T < 1s		+45	V
V _{BATr2}	Transient supply voltage	ISO 7637/1 test pulse 2 (SAE J1113, test pulse 2), with series diode and bypass cap of 100 nF between BAT and GND pins, Note 2.		+100	V
V _{BATr3}	Transient supply voltage	ISO 7637/1 pulses 3a and 3b (SAE J1113 test pulse 3a and 3b), Note 2.	−150	+100	V
V _{CANH_1}	CANH voltage	V _{BAT} > 2 V	−10	+18	V
V _{CANH_0}	CANH voltage	V _{BAT} < 2 V	−16	+18	V
V _{CANHtr1}	Transient bus voltage	ISO 7637/1 test pulse 1, Notes 1 and 2	−100		V
V _{CANHtr2}	Transient bus voltage	ISO 7637/1 test pulse 2, Notes 1 and 2		+100	V
V _{CANHtr3}	Transient bus voltage	ISO 7637/1 test pulses 3a, 3b, Notes 1 and 2	−150	+100	V
V _{RTH1}	Pin RTH voltage	V _{BAT} > 2 V, voltage applied to pin RTH via a 2 kΩ series resistor	−10	+18	V
V _{RTH0}	Pin RTH voltage	V _{BAT} < 2 V, voltage applied to pin RTH via a 2 kΩ series resistor	−16	+18	V
V _I	DC voltage on pins TxD, EN, RxD, NSTB		−0.3	+7	V
ESD _{BAHB}	ESD capability of pin BAT	Direct contact discharge, R=1.5 kΩ, C=100 pF	−8	+8	kV
ESD _{CHHB}	ESD capability of pin CANH	Direct contact discharge, R=1.5 kΩ, C=100 pF	−8	+8	kV
ESD _{RTHB}	ESD capability of pin RTH	Direct contact discharge, R=1.5 kΩ + 3 kΩ, C=100 pF	−8	+8	kV
ESD _{LGHB}	ESD capability of pins TxD, NSTB, EN, RxD	Direct contact discharge, R=1.5 kΩ, C=100 pF	−2	+2	kV
R _{Tmin}	Bus load resistance R _T being connected to pin RTH		2		kΩ
T _{amb}	Operating ambient temperature		−40	+125	°C
T _{stg}	Storage temperature		−40	+150	°C
T _{vj}	Junction temperature		−40	+150	°C

NOTES:

- Test pulses are coupled to CANH through a series capacitance of 1 nF.
- Rise time for test pulse 1: t_r < 1 μs; pulse 2: t_r < 100 ns; pulses 3a/3b: t_r < 5 ns.

t_{DW}	Receive delay in wake-up mode, bus rising and falling edge	NSTB = 0 V, EN = 5 V; $5.5\ \text{V} < V_{BAT} < 27\ \text{V}$; CANH to RxD time measured from $V_{CANH} = 2.0\ \text{V}$ to $V_{RxD} = 2.5\ \text{V}$	0.3		1	μs
t_{DHS}	Receive delay in high-speed mode, bus rising and falling edge	NSTB = 5 V, EN = 0 V; $8\ \text{V} < V_{BAT} < 16\ \text{V}$; CANH to RxD time measured from $V_{CANH} = 2.0\ \text{V}$ to $V_{RxD} = 2.5\ \text{V}$	0.3		1	μs
t_{DS}	Receive delay in sleep mode, bus rising edge	NSTB = 0 V, EN = 0 V; CANH to RxD time, measured from $V_{CANH} = \min\{(V_{BAT} - 3.78\ \text{V}), 7.13\ \text{V}\}$ to $V_{RxD} = 2.5\ \text{V}$	10		70	μs

NOTES:

1. Operation at battery voltages higher than 16 V is recommended to be shorter than 2 minutes.
2. This parameter is characterized but not subject to production test.

TEST CIRCUITS

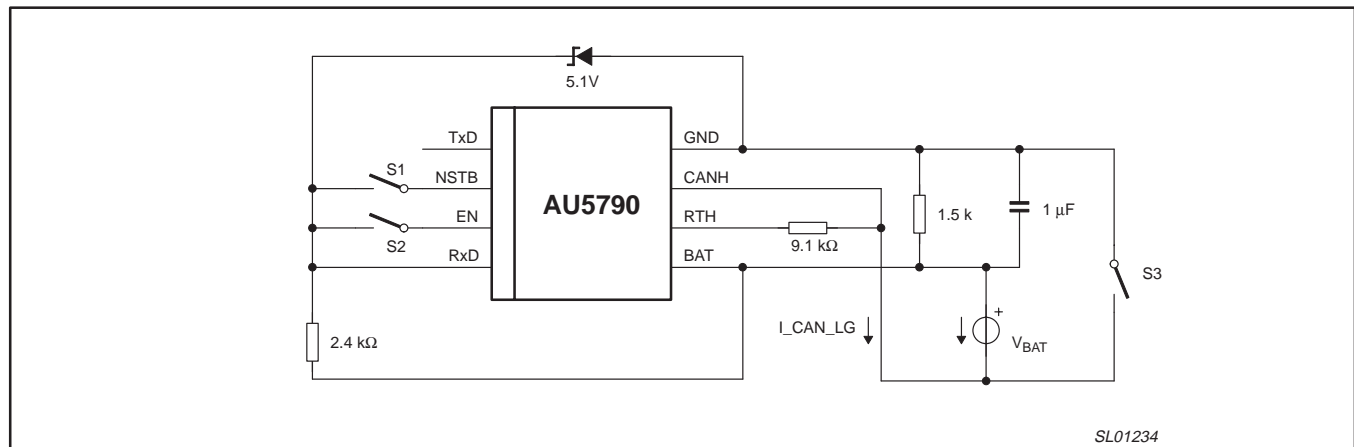

Figure 2. Loss of ground test circuit

NOTES:

Opening S3 simulates loss of module ground.

Check I_CAN_LG with the following switch positions to simulate loss of ground in all modes:

1. S1 = open = S2
2. S1 = open, S2 = closed
3. S1 = closed, S2 = open
4. S1 = closed = S2

APPLICATION INFORMATION

The information provided in this Section is not part of the IC specification, but is presented for information purpose only.

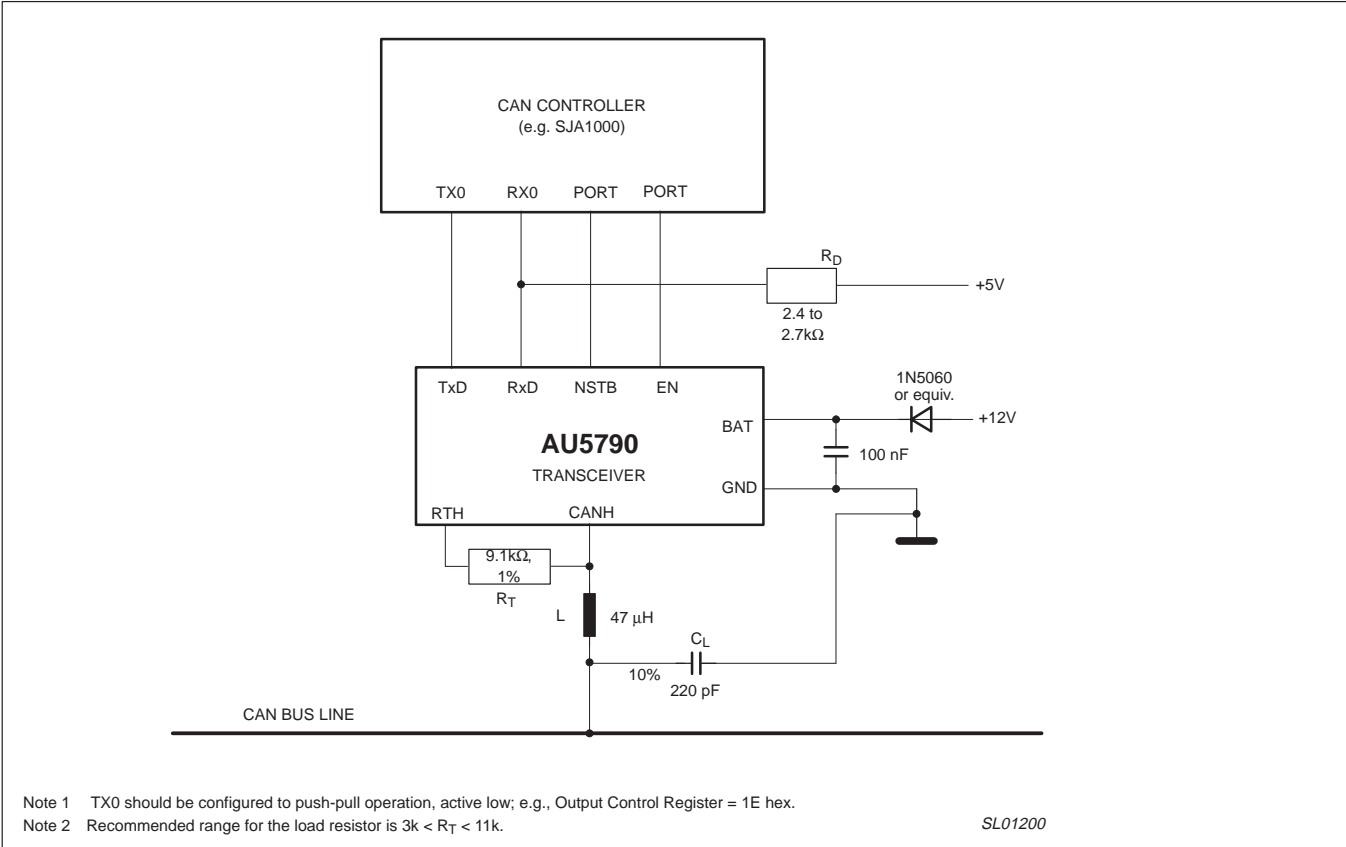

Figure 3. Application circuit example for the AU5790

Table 2. Maximum CAN Bit Rate

MODE	MAXIMUM BIT RATE AT 0.35% CLOCK ACCURACY
Normal transmission	33.3 kbps
High-speed transmission	83.3 kbps
Sample point as % of bit time	85%
Bus Time constant, normal mode	1.0 to 4.0 μs

Single wire CAN transceiver

AU5790

THERMAL CHARACTERISTICS

The AU5790 provides protection from thermal overload. When the IC junction temperature reaches the threshold ($\approx 155^{\circ}\text{C}$), the AU5790 will disable the transmitter drivers, reducing power dissipation to protect the device. The transmit function will become available again after the junction temperature drops. The thermal shutdown hysteresis is about 5°C .

In order to avoid this transmit function shutdown, care must be taken to not overheat the IC during application. The relationships between junction temperature, ambient temperature, dissipated power, and thermal resistance can be expressed as:

$$T_j = T_a + P_d \cdot \theta_{ja}$$

where: T_j is junction temperature ($^{\circ}\text{C}$);

T_a is ambient temperature ($^{\circ}\text{C}$);

P_d is dissipated power (W);

θ_{ja} is thermal resistance ($^{\circ}\text{C}/\text{W}$).

Thermal Resistance

Thermal resistance is the ability of a packaged IC to dissipate heat to its environment. In semiconductor applications, it is highly dependant on the IC package, PCBs, and airflow. Thermal resistance also varies slightly with input power, the difference between ambient and junction temperatures, and soldering material.

Figures 4 and 5 show the thermal resistance as the function of the IC package and the PCB configuration, assuming no airflow.

Figure 4. SO-8 Thermal Resistance vs. PCB Configuration

Figure 5. SO-14 Thermal Resistance vs. PCB Configuration

Single wire CAN transceiver

AU5790

Table 3 shows the maximum power dissipation of an AU5790 without tripping the thermal overload protection, for specified combinations of package, board configuration, and ambient temperature.

Table 3. Maximum power dissipation

Board Type	Additional Foil Area for Heat Dissipation	Θ_{JA}	P_{tot}	
		Thermal Resistance	Power Dissipation Max.	
			$T_a = 85^\circ\text{C}$	$T_a = 125^\circ\text{C}$
		K/W	mW	mW
SO-8 on High Conductance Board	Normal traces	103	631	243
	225 Sq. mm of copper foil attached to pin 8.	82	793	305
SO-8 on Low Conductance Board	Normal traces	163	399	153
	225 Sq. mm of copper attached to pin 8.	119	546	210
SO-8 on Very Low Conductance Board	Normal traces	194	335	129
	225 Sq. mm of copper attached to pin 8.	135	481	185
SO-14 on High Conductance Board	Normal traces	63	1032	397
	105 Sq. mm of copper attached to each of pins 1, 7, 8, & 14.	50	1300	500
SO-14 on Low Conductance Board	Normal traces	103	631	243
	105 Sq. mm of copper attached to each of pins 1, 7, 8, & 14.	70	929	357
SO-14 on Very Low Conductance Board	Normal traces	126	516	198
	105 Sq. mm of copper attached to each of pins 1, 7, 8, & 14.	82	793	305

NOTES:

1. The High Conductance board is based on modeling done to EIA/JEDEC Standard JESD51-7. The board emulated contains two one ounce thick copper ground planes, and top surface copper conductor traces of two ounce (0.071 mm thickness of copper).
2. The Low Conductance board is based on modeling done to EIA/JEDEC Standard EIA/JESD51-3. The board does not contain any ground planes, and the top surface copper conductor traces of two ounce (0.071 mm thickness of copper).
3. The Very Low Conductance board is based on the EIA/JESD51-3, however the thickness of the surface conductors has been reduced to 0.035 mm (also referred to as 1.0 Ounce copper).
4. The above mentioned JEDEC specifications are available from: <http://www.jedec.org/>

Single wire CAN transceiver

AU5790

Power Dissipation

Power dissipation of an IC is the major factor determining junction temperature. AU5790 power dissipation in active and passive states are different. The average power dissipation is:

$$P_{\text{tot}} = P_{\text{INT}} \cdot Dy + P_{\text{PNINT}} \cdot (1 - Dy)$$

where: P_{tot} is total dissipation power;

P_{INT} is dissipation power in an active state;

P_{PNINT} is dissipation power in a passive state;

Dy is duty cycle, which is the percentage of time that TxD is in an active state during any given time duration.

At passive state there is no current going into the load. So all of the supply current is dissipated inside the IC.

$$P_{\text{PNINT}} = V_{\text{BAT}} \cdot I_{\text{BATPN}}$$

where: V_{BAT} is the battery voltage;

I_{BATPN} is the passive state supply current in normal mode.

In an active state, part of the supply current goes to the load, and only part of the supply current dissipates inside the IC, causing an incremental increase in junction temperature.

$$P_{\text{INT}} = P_{\text{BATAN}} - P_{\text{LOADN}}$$

where: P_{BATAN} is active state battery supply power in normal mode;

$$P_{\text{BATAN}} = V_{\text{BAT}} \cdot I_{\text{BATAN}}$$

P_{LOADN} is load power consumption in normal mode.

$$P_{\text{LOADN}} = V_{\text{CANHN}} \cdot I_{\text{LOADN}}$$

where: I_{BATAN} is active state supply current in normal mode;

V_{CANHN} is bus output voltage in normal mode;

I_{LOADN} is current going through load in normal mode.

$$I_{\text{LOAD}} = V_{\text{CANHN}} / R_{\text{LOAD}}$$

$$I_{\text{BATN}} = I_{\text{LOAD}} + I_{\text{INT}}$$

where: I_{INT} is an active state current dissipated within the IC in normal mode.

I_{INT} will decrease slightly when the node number decreases. To simplify this analysis, we will assume I_{INT} is fixed.

$$I_{\text{INT}} = I_{\text{BATN}} (32 \text{ nodes}) - I_{\text{LOAD}} (32 \text{ nodes})$$

$I_{\text{BATN}} (32 \text{ nodes})$ may be found in the DC Characteristics table.

A power dissipation example follows. The assumed values are chosen from specification and typical applications.

Assumptions:

$$V_{\text{BAT}} = 13.4 \text{ V}$$

$$R_T = 9.1 \text{ k}\Omega$$

$$32 \text{ nodes}$$

$$I_{\text{BATPN}} = 2 \text{ mA}$$

$$I_{\text{BATN}} (32 \text{ nodes}) = 35 \text{ mA}$$

$$V_{\text{CANHN}} = 4.55 \text{ V}$$

$$\text{Duty cycle} = 50\%$$

Computations:

$$R_{\text{LOAD}} = 9.1 \text{ k}\Omega / 32 = 284.4 \Omega$$

$$P_{\text{PNINT}} = 13.4 \text{ V} \times 2 \text{ mA} = 26.8 \text{ mW}$$

$$I_{\text{LOAD}} = 4.55 \text{ V} / 284.4 \Omega = 16 \text{ mA}$$

$$P_{\text{LOADN}} = 4.55 \text{ V} \times 16 \text{ mA} = 72.8 \text{ mW}$$

$$I_{\text{INT}} = 35 \text{ mA} - 16 \text{ mA} = 19 \text{ mA}$$

$$P_{\text{BATAN}} = 13.4 \text{ V} \times 35 \text{ mA} = 469 \text{ mW}$$

$$P_{\text{INT}} = 469 \text{ mW} - 72.8 \text{ mW} = 396.2 \text{ mW}$$

$$P_{\text{tot}} = 396.2 \text{ mW} \times 50\% + 26.8 \text{ mW} \times (1 - 50\%) = 211.5 \text{ mW}$$

Additional examples with various node counts are shown in Table 4.

Table 4. Representative Power Dissipation Analyses

Nodes	$R_{\text{LOAD}} (\Omega)$	$V_{\text{BAT}} (\text{V})$	$I_{\text{BATPN}} (\text{mA})$	$P_{\text{PNINT}} (\text{mW})$	$V_{\text{CANHN}} (\text{V})$	$I_{\text{LOAD}} (\text{mA})$	$I_{\text{BATN}} (\text{mA})$	$I_{\text{INT}} (\text{mA})$	$P_{\text{INT}} (\text{mW})$	Dcycle	$P_{\text{tot}} (\text{mW})$
2	4550	13.4	2	26.8	4.55	1	20	19	263.5	0.5	145.1

Data sheet status

Data sheet status	Product status	Definition [1]
Objective specification	Development	This data sheet contains the design target or goal specifications for product development. Specification may change in any manner without notice.
Preliminary specification	Qualification	This data sheet contains preliminary data, and supplementary data will be published at a later date. Philips Semiconductors reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
Product specification	Production	This data sheet contains final specifications. Philips Semiconductors reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.

[1] Please consult the most recently issued datasheet before initiating or completing a design.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
