

# **AN3495K, AN3495S**

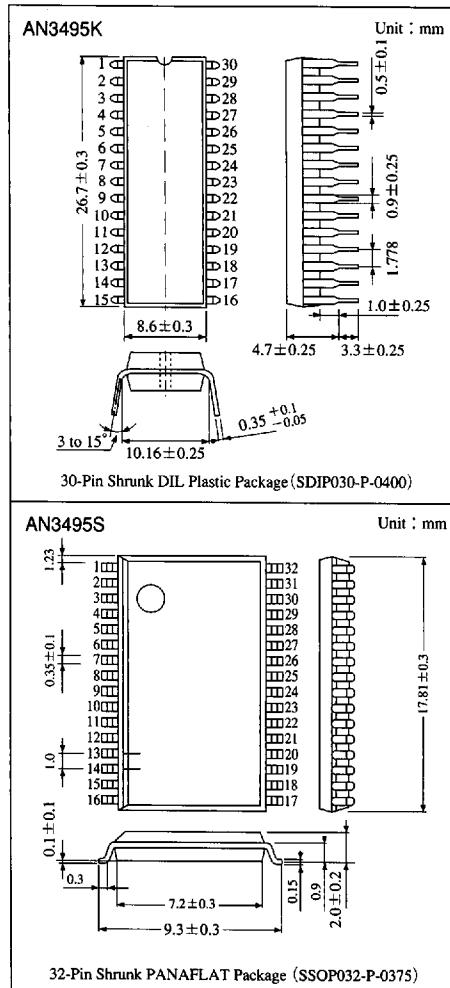

## **YNR and CNR ICs for VCR**

### **■ Overview**

The AN3495K and AN3495S are the ICs designed to reduce noise of luminance and chroma signal as for the VHS HQ functions. Incorporating the switches available for S-VHS, it can configure a VHS or S-VHS signal processing system in combination with the AN3230 (VHS luminance signal processing), AN3237 (S-VHS luminance signal processing), and AN3411 (chroma signal processing).

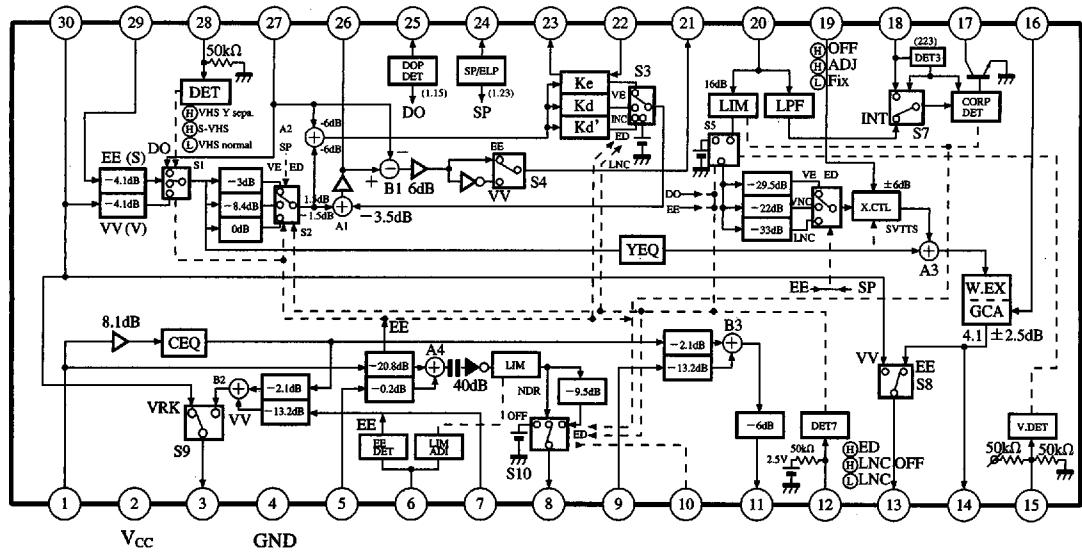

### **■ Features**

- YNR function.
- CNR function.
- Luminance signal base band dropout compensating function.
- Luminance signal 1H non-correlative detection sequential pulse output function.
- S-VHS/VHS switch and Rec Y/C comb type separation switch built-in.
- Capable of adjusting the YNR X value by external DC voltage.
- Capable of adjusting the CNR limiter level by external DC voltage.
- YNR has vertical emphasis/de-emphasis characteristics in recording/playback and can select 3 kinds of characteristics (NORMAL, EDIT, LNC) at playback.
- CNR is a chroma recursive system at playback.
