14-CHANNEL T1/E1/J1 LONG-HAUL/SHORT-HAUL LINE INTERFACE UNIT

NOVEMBER 2003   *REV. P1.0.3*

GENERAL DESCRIPTION

The XRT83L314 is a fully integrated 14-channel long-haul and short-haul line interface unit (LIU) that operates from a single 3.3V power supply. Using internal termination, the LIU provides one bill of materials to operate in T1, E1, or J1 mode independently on a per channel basis with minimum external components. The LIU features are programmed through a standard microprocessor interface. EXAR's LIU has patented high impedance circuits that allow the transmitter outputs and receiver inputs to be high impedance when experiencing a power failure or when the LIU is powered off. Key design features within the LIU optimize 1:1 or 1+1 redundancy and non-intrusive monitoring applications to ensure reliability without using relays.

The on-chip clock synthesizer generates T1/E1/J1 clock rates from a selectable external clock frequency and has five output clock references that can be used for external timing (8kHz, 1.544Mhz, 2.048Mhz, nxT1/J1, nxE1).

Additional features include RLOS, a 16-bit LCV counter for each channel, AIS, QRSS generation/detection, Network Loop Code generation/detection, TAOS, DMO, and diagnostic loopback modes.

APPLICATIONS

- T1 Digital Cross Connects (DSX-1)
- ISDN Primary Rate Interface
- CSU/DSU E1/T1/J1 Interface
- T1/E1/J1 LAN/WAN Routers
- Public Switching Systems and PBX Interfaces
- T1/E1/J1 Multiplexer and Channel Banks
- Integrated Multi-Service Access Platforms (IMAPs)
- Integrated Access Devices (IADs)
- Inverse Multiplexing for ATM (IMA)
- Wireless Base Stations

FIGURE 1. BLOCK DIAGRAM OF THE XRT83L314
FEATURES

- Fully integrated 14-Channel short haul and long haul transceivers for T1/J1 (1.544MHz) and E1 (2.048MHz) applications.

- T1/E1/J1 short haul, long haul, and clock rate are per port selectable through software without changing components.

- Internal Impedance matching on both receive and transmit for 75Ω (E1), 100Ω (T1), 110Ω (J1), and 120Ω (E1) applications are per port selectable through software without changing components.

- Power down on a per channel basis with independent receive and transmit selection.

- Five pre-programmed transmit pulse settings for T1 short haul applications.

- Arbitrary pulse generator for T1 and E1 modes.

- Transmit line build outs (LBO) for T1 long haul applications from 0dB to -22.5dB in three -7.5dB steps on a per channel basis.

- On-Chip transmit short-circuit protection and limiting protects line drivers from damage on a per channel basis.

- Independent Crystal-Less digital jitter attenuators (JA) with 32-Bit or 64-Bit FIFO for the receive and transmit paths

- On-Chip frequency multiplier generates T1 or E1 master clocks from a variety of external clock sources (8, 16, 56, 64, 128, 256kHz and 1X, 2X, 4X, 8X T1 or E1)

- Driver failure monitor output (DMO) alerts of possible system or external component problems.

- Transmit outputs and receive inputs may be "High" impedance for protection or redundancy applications on a per channel basis.

- Support for automatic protection switching.

- 1:1 and 1+1 protection without relays.

- Selectable receiver sensitivity from 0 to 36dB cable loss in T1 @ 772kHz, and 0 to 43dB cable loss in E1 @ 1,024kHz.

- Receive monitor mode handles 0 to 29dB resistive attenuation (flat loss) along with 0 to 6dB cable loss for both T1 and E1.

- Receiver line attenuation indication output in 1dB steps.

- Loss of signal (RLOS) according to ITU-T G.775/ETS300233 (E1) and ANSI T1.403 (T1/J1).

- Programmable receive slicer threshold (45%, 50%, 55%, or 68%) for improved receiver interference immunity.

- Programmable data stream muting upon RLOS detection.

- On-Chip HDB3/B8ZS encoder/decoder with an internal 16-bit LCV counter for each channel.

- On-Chip digital clock recovery circuit for high input jitter tolerance.

- QRSS pattern generator and detection for testing and monitoring.

- Error and bipolar violation insertion and detection.

- Transmit all ones (TAOS) and in-band network loop up and loop down code generation.

- Automatic loop code detection for remote loopback activation.

- Supports local analog, remote, digital, and dual loopback modes.

- Low Power dissipation: 170mW per channel (50% density).

- 250mW per channel maximum power dissipation (100% density).

- Single 3.3V supply operation (3V to 5V I/O tolerant).

- 304-Pin TBGA package

- -40°C to +85°C Temperature Range

- Supports gapped clocks for mapper/multiplexer applications.

PRODUCT ORDERING INFORMATION

TABLE OF CONTENTS

PIN DESCRIPTIONS

MICROPROCESSOR

NAME	PIN	TYPE	DESCRIPTION
$\overline{\text{CS}}$	A22	I	**Chip Select Input** Active low signal. This signal enables the microprocessor interface by pulling chip select "Low". The microprocessor interface is disabled when the chip select signal returns "High".
ALE_TS	C19	I	**Address Latch Enable Input (Transfer Start)** See the Microprocessor section of this datasheet for a description.
$\overline{\text{WR}}\_\text{R}/\overline{\text{W}}$	A20	I	**Write Strobe Input (Read/Write)** See the Microprocessor section of this datasheet for a description.
$\overline{\text{RD}}\_\overline{\text{WE}}$	D18	I	**Read Strobe Input (Write Enable)** See the Microprocessor section of this datasheet for a description.
$\overline{\text{RDY}}\_\overline{\text{TA}}$	AA3	O	**Ready Output (Transfer Acknowledge)** See the Microprocessor section of this datasheet for a description.
$\overline{\text{INT}}$	B3	O	**Interrupt Output** Active low signal. This signal is asserted "Low" when a change in alarm status occurs. Once the status registers have been read, the interrupt pin will return "High". GIE (Global Interrupt Enable) must be set "High" in the appropriate global register to enable interrupt generation. ***NOTE:*** *This pin is an open-drain output that requires an external 10KΩ pull-up resistor.*
µPCLK	AB2	I	**Micro Processor Clock Input** In a synchronous microprocessor interface, µPCLK is used as the internal timing reference for programming the LIU.
ADDR10 ADDR9 ADDR8 ADDR7 ADDR6 ADDR5 ADDR4 ADDR3 ADDR2 ADDR1 ADDR0	A23 E20 C22 Y18 AA19 AB20 AC21 AB21 AA20 Y19 AC22	I	**Address Bus Input** ADDR[10:8] is used as a chip select decoder. The LIU has 5 chip select output pins for enabling up to 5 additional devices for accessing internal registers. The LIU has the option to select itself (master device), up to 5 additional devices, or all 6 devices simultaneously by setting the ADDR[10:8] pins specified below. ADDR[7:0] is a direct address bus for permitting access to the internal registers. **ADDR[10:8]** 000 = Master Device 001 = Chip Select Output 1 (Pin B21) 010 = Chip Select Output 2 (Pin D19) 011 = Chip Select Output 3 (Pin C20) 100 = Chip Select Output 4 (Pin A21) 101 = Chip Select Output 5 (Pin B20) 110 = Reserved 111 = All Chip Selects Active Including the Master Device

MICROPROCESSOR

NAME	PIN	TYPE	DESCRIPTION
DATA7 DATA6 DATA5 DATA4 DATA3 DATA2 DATA1 DATA0	AA4 AB3 AC3 AA5 Y6 AB4 AC4 AB5	I/O	**Bi-directional Data Bus** DATA[7:0] is a bi-directional data bus used for read and write operations.
μPTS2 μPTS1 μPTS0	AC23 AB22 AA21	I	**Microprocessor Type Select Input** μPTS[2:0] are used to select the microprocessor type interface. 000 = Intel 68HC11, 8051, 80C188 (Asynchronous) 001 = Motorola 68K (Asynchronous) 111 = Motorola MPC8260, MPC860 Power PC (Synchronous)
$\overline{\text{Reset}}$	B22	I	**Hardware Reset Input** Active low signal. When this pin is pulled "Low" for more than 10μS, the internal registers are set to their default state. See the register description for the default values. ***NOTE:*** *Internally pulled "High" with a 50KΩ resistor.*
$\overline{\text{CS5}}$ $\overline{\text{CS4}}$ $\overline{\text{CS3}}$ $\overline{\text{CS2}}$ $\overline{\text{CS1}}$	B20 A21 C20 D19 B21	O	**Chip Select Output** The XRT83L314 can be used to provide the necessary chip selects for up to 5 additional devices by using the 3 MSBs ADDR[10:8] from the 11-Bit address bus. The LIU allows up to 84-channel applications with only using one chip select. See the ADDR[10:0] definition in the pin description.

RECEIVER SECTION

NAME	PIN	TYPE	DESCRIPTION
RxON	AB19	I	**Receive On/Off Input** Upon power up, the receivers are powered off. Turning the receivers On or Off can be selected through the microprocessor interface by programming the appropriate channel register if the hardware pin is pulled "High". If the hardware pin is pulled "Low", all channels are automatically turned off. ***NOTE:*** *Internally pulled "Low" with a 50KΩ resistor.*
RxTSEL	Y15	I	**Receive Termination Control** Upon power up, the receivers are in "High" impedance. Switching to internal termination can be selected through the microprocessor interface by programming the appropriate channel register. However, to switch control to the hardware pin, RxTCNTL must be programmed to "1" in the appropriate global register. Once control has been granted to the hardware pin, it must be pulled "High" to switch to internal termination. ***NOTE:*** *Internally pulled "Low" with a 50kΩ resistor.*

RECEIVER SECTION

NAME	PIN	TYPE	DESCRIPTION
RLOS	AB1	O	**Receive Loss of Signal (Global Pin for All 14-Channels)** When a receive loss of signal occurs for any one of the 14-channels according to ITU-T G.775, the RLOS pin will go "High" for a minimum of one RCLK cycle. RLOS will remain "High" until the loss of signal condition clears. See the Receive Loss of Signal section of this datasheet for more details. *NOTE: This pin is for redundancy applications to initiate an automatic switch to the backup card. For individual channel RLOS, see the register map.*
RCLK13 RCLK12 RCLK11 RCLK10 RCLK9 RCLK8 RCLK7 RCLK6 RCLK5 RCLK4 RCLK3 RCLK2 RCLK1 RCLK0	AB14 Y22 R22 P22 G22 F22 B14 B9 F2 G2 P2 R2 AA2 AA9	O	**Receive Clock Output** RCLK is the recovered clock from the incoming data stream. If the incoming signal is absent or RxON is pulled "Low", RCLK maintains its timing by using an internal master clock as its reference. RPOS/RNEG data can be updated on either edge of RCLK selected by RCLKE in the appropriate global register. *NOTE: RCLKE is a global setting that applies to all 14 channels.*
RPOS13 RPOS12 RPOS11 RPOS10 RPOS9 RPOS8 RPOS7 RPOS6 RPOS5 RPOS4 RPOS3 RPOS2 RPOS1 RPOS0	Y14 W20 P20 N20 H20 G20 D14 D10 G4 H4 N4 P4 W4 Y10	O	**RPOS/RDATA Output** Receive digital output pin. In dual rail mode, this pin is the receive positive data output. In single rail mode, this pin is the receive non-return to zero (NRZ) data output.

RECEIVER SECTION

NAME	PIN	TYPE	DESCRIPTION
RNEG13 RNEG12 RNEG11 RNEG10 RNEG9 RNEG8 RNEG7 RNEG6 RNEG5 RNEG4 RNEG3 RNEG2 RNEG1 RNEG0	AA14 Y21 P21 N21 H21 G21 C14 C10 F3 G3 N3 P3 Y3 AA10	O	**RNEG/LCV_OF Output** In dual rail mode, this pin is the receive negative data output. In single rail mode, this pin is a Line Code Violation / Counter Overflow indicator. If LCV is selected by programming the appropriate global register and If a line code violation, bi-polar violation, or excessive zeros occur, the LCV pin will pull "High" for a minimum of one RCLK cycle. LCV will remain "High" until there are no more violations. However, if OF is selected the LCV pin will pull "High" if the internal LCV counter is saturated. The LCV pin will remain "High" until the LCV counter is reset.
RTIP13 RTIP12 RTIP11 RTIP10 RTIP9 RTIP8 RTIP7 RTIP6 RTIP5 RTIP4 RTIP3 RTIP2 RTIP1 RTIP0	AC14 Y23 T23 P23 G23 E23 A14 A9 E1 G1 P1 T1 Y1 AC9	I	**Receive Differential Tip Input** RTIP is the positive differential input from the line interface. Along with the RRING signal, these pins should be coupled to a 1:1 transformer for proper operation.
RRING13 RRING12 RRING11 RRING10 RRING9 RRING8 RRING7 RRING6 RRING5 RRING4 RRING3 RRING2 RRING1 RRING0	AC13 W23 U23 N23 H23 D23 A13 A10 D1 H1 N1 U1 W1 AC10	I	**Receive Differential Ring Input** RRING is the negative differential input from the line interface. Along with the RTIP signal, these pins should be coupled to a 1:1 transformer for proper operation.

TRANSMITTER SECTION

NAME	PIN	TYPE	DESCRIPTION
TxON	AC20	I	**Transmit On/Off Input** Upon power up, the transmitters are powered off. Turning the transmitters On or Off is selected through the microprocessor interface by programming the appropriate channel register if this pin is pulled "High". If the TxON pin is pulled "Low", all 14 transmitters are powered off. *NOTE: TxON is ideal for redundancy applications. See the Redundancy Applications Section of this datasheet for more details. Internally pulled "Low" with a 50KΩ resistor.*
DMO	Y4	O	**Digital Monitor Output (Global Pin for All 14-Channels)** When no transmit output pulse is detected for more than 128 TCLK cycles on one of the 14-channels, the DMO pin will go "High" for a minimum of one TCLK cycle. DMO will remain "High" until the transmitter sends a valid pulse. *NOTE: This pin is for redundancy applications to initiate an automatic switch to the backup card. For individual channel DMO, see the register map.*
TCLK13 TCLK12 TCLK11 TCLK10 TCLK9 TCLK8 TCLK7 TCLK6 TCLK5 TCLK4 TCLK3 TCLK2 TCLK1 TCLK0	Y16 Y17 AC18 D16 C17 A19 B16 D7 A3 B5 B6 AC6 AC5 AC7	I	**Transmit Clock Input** TCLK is the input facility clock used to sample the incoming TPOS/TNEG data. If TCLK is absent, pulled "Low", or pulled "High", the transmitter outputs at TTIP/TRING can be selected to send an all ones or an all zero signal by programming TCLKCNL in the appropriate global register. TPOS/TNEG data can be sampled on either edge of TCLK selected by TCLKE in the appropriate global register. *NOTE: TCLKE is a global setting that applies to all 14 channels.*
TPOS13 TPOS12 TPOS11 TPOS10 TPOS9 TPOS8 TPOS7 TPOS6 TPOS5 TPOS4 TPOS3 TPOS2 TPOS1 TPOS0	AB17 AA18 AB18 A18 D17 B19 A17 B7 C4 B4 D6 AB6 AA6 Y8	I	**TPOS/TDATA Input** Transmit digital input pin. In dual rail mode, this pin is the transmit positive data input. In single rail mode, this pin is the transmit non-return to zero (NRZ) data input. *NOTE: Internally pulled "Low" with a 50KΩ resistor.*

TRANSMITTER SECTION

NAME	PIN	TYPE	DESCRIPTION
TNEG13 TNEG12 TNEG11 TNEG10 TNEG9 TNEG8 TNEG7 TNEG6 TNEG5 TNEG4 TNEG3 TNEG2 TNEG1 TNEG0	AC17 AC19 AA17 B17 B18 C18 C16 C7 D5 C5 C6 AA7 Y7 AB7	I	**Transmit Negative Data Input** In dual rail mode, this pin is the transmit negative data input. In single rail mode, this pin can be left unconnected. *NOTE: Internally pulled "Low" with a 50KΩ resistor.*
TTIP13 TTIP12 TTIP11 TTIP10 TTIP9 TTIP8 TTIP7 TTIP6 TTIP5 TTIP4 TTIP3 TTIP2 TTIP1 TTIP0	AA13 W21 R21 M21 J21 F21 C13 C11 E3 H3 M3 R3 W3 AA11	O	**Transmit Differential Tip Output** TTIP is the positive differential output to the line interface. Along with the TRING signal, these pins should be coupled to a 1:2 step up transformer for proper operation.
TRING13 TRING12 TRING11 TRING10 TRING9 TRING8 TRING7 TRING6 TRING5 TRING4 TRING3 TRING2 TRING1 TRING0	AB12 V22 T20 M22 J22 D22 B12 B11 C2 H2 M2 U2 V3 AB11	O	**Transmit Differential Ring Output** TRING is the negative differential output to the line interface. Along with the TTIP signal, these pins should be coupled to a 1:2 step up transformer for proper operation.

CONTROL FUNCTION

NAME	PIN	TYPE	DESCRIPTION
TEST	D4	I	**Factory Test Mode** For normal operation, the TEST pin should be tied to ground. ***NOTE:*** *Internally pulled "Low" with a 50kΩ resistor.*
$\overline{\text{ICT}}$	A2	I	**In Circuit Testing** When this pin is tied "Low", all output pins are forced to "High" impedance for in circuit testing. ***NOTE:*** *Internally pulled "High" with a 50KΩ resistor.*

CLOCK SECTION

NAME	PIN	TYPE	DESCRIPTION
MCLKin	A6	I	**Master Clock Input** The master clock input can accept a wide range of inputs that can be used to generate T1 or E1 clock rates on a per channel basis. See the register map for details.
8kHzOUT	D8	O	**8kHz Output Clock**
MCLKE1out	A5	O	**2.048MHz Output Clock**
MCLKE1Nout	A4	O	**2.048MHz, 4.096MHz, 8.192MHz, or 16.384MHz Output Clock** See the register map for programming details.
MCLKT1out	A7	O	**1.544MHz Output Clock**
MCLKT1Nout	B8	O	**1.544MHz, 3.088MHz, 6.176MHz, or 12.352MHz Output Clock** See the register map for programming details.

POWER AND GROUND

NAME	PIN	TYPE	DESCRIPTION

1.0   CLOCK SYNTHESIZER

In system design, fewer clocks on the network card could reduce noise and interference. Common clock references such as 8kHz are readily available to network designers. Network cards that support both T1 and E1 modes must be able to produce 1.544MHz and 2.048MHz transmission data. The XRT83L314 has a built in clock synthesizer that requires only one input clock reference by programming CLKSEL[3:0] in the appropriate global register. A list of the input clock options is shown in Table 1.

TABLE 1: INPUT CLOCK SOURCE SELECT

CLKSEL[3:0]	INPUT CLOCK REFERENCE
0h (0000)	2.048 MHz
1h (0001)	1.544MHz
2h (0010)	8 kHz
3h (0011)	16 kHz
4h (0100)	56 kHz
5h (0101)	64 kHz
6h (0110)	128 kHz
7h (0111)	256 kHz
8h (1000)	4.096 MHz
9h (1001)	3.088 MHz
Ah (1010)	8.192 MHz
Bh (1011)	6.176 MHz
Ch (1100)	16.384 MHz
Dh (1101)	12.352 MHz
Eh (1110)	2.048 MHz
Fh (1111)	1.544 MHz

The single input clock reference is used to generate multiple timing references. The first objective of the clock synthesizer is to generate 1.544MHz and 2.048MHz for each of the 14 channels. This allows each channel to operate in either T1 or E1 mode independent from the other channels. The state of the equalizer control bits in the appropriate channel registers determine whether the LIU operates in T1 or E1 mode. The second objective is to generate additional output clock references for system use. The available output clock references are shown in Figure 2.

FIGURE 2. SIMPLIFIED BLOCK DIAGRAM OF THE CLOCK SYNTHESIZER
1.1 ALL T1/E1 Mode

To reduce system noise and power consumption, the XRT83L314 offers an ALL T1/E1 mode. Since most line card designs are configured to operate in T1 or E1 only, the LIU can be selected to shut off the timing references for the mode not being used by programming the appropriate global register. By default the ALL T1/E1 mode is enabled (ALLT1/E1 bit = "0"). If the LIU is configured for T1, all E1 clock references and the 8kHz reference are shut off internally to the chip. This reduces the amount of internal clocks switching within the LIU, hence reducing noise and power consumption. In E1 mode, the T1 clock references are internally shut off, however the 8kHz reference is available. To disable this feature, the ALLT1/E1 bit must be set to a "1" in the appropriate global register.

2.0 RECEIVE PATH LINE INTERFACE

The receive path of the XRT83L314 LIU consists of 14 independent T1/E1/J1 receivers. The following section describes the complete receive path from RTIP/RRING inputs to RCLK/RPOS/RNEG outputs. A simplified block diagram of the receive path is shown in Figure 3.

FIGURE 3. SIMPLIFIED BLOCK DIAGRAM OF THE RECEIVE PATH
2.1 Line Termination (RTIP/RRING)

2.1.1 CASE 1: Internal Termination

The input stage of the receive path accepts standard T1/E1/J1 twisted pair or E1 coaxial cable inputs through RTIP and RRING. The physical interface is optimized by placing the terminating impedance inside the LIU. This allows one bill of materials for all modes of operation reducing the number of external components necessary in system design. The receive termination (along with the transmit termination) impedance is selected by programming TERSEL[1:0] to match the line impedance. Selecting the internal impedance is shown in Table 2.

TABLE 2: SELECTING THE INTERNAL IMPEDANCE

TERSEL[1:0]	RECEIVE TERMINATION
0h (00)	100Ω
1h (01)	110Ω
2h (10)	75Ω
3h (11)	120Ω

The XRT83L314 has the ability to switch the internal termination to "High" impedance by programming RxTSEL in the appropriate channel register. For internal termination, set RxTSEL to "1". By default, RxTSEL is set to "0" ("High" impedance). For redundancy applications, a dedicated hardware pin (RxTSEL) is also available to control the receive termination for all channels simultaneously. This hardware pin takes priority over the register setting if RxTCNTL is set to "1" in the appropriate global register. If RxTCNTL is set to "0", the state of this pin is ignored. See Figure 4 for a typical connection diagram using the internal termination.

FIGURE 4. TYPICAL CONNECTION DIAGRAM USING INTERNAL TERMINATION
2.1.2 CASE 2: Internal Termination With One External Fixed Resistor for All Modes

Along with the internal termination, a high precision external fixed resistor can be used to optimize the return loss. This external resistor can be used for all modes of operation ensuring one bill of materials. There are three resistor values that can be used by setting the RxRES[1:0] bits in the appropriate channel register. Selecting the value for the external fixed resistor is shown in Table 3.

TABLE 3: SELECTING THE VALUE OF THE EXTERNAL FIXED RESISTOR

RxRES[1:0]	EXTERNAL FIXED RESISTOR
0h (00)	None
1h (01)	240Ω
2h (10)	210Ω
3h (11)	150Ω

By default, RxRES[1:0] is set to "None" for no external fixed resistor. If an external fixed resistor is used, the XRT83L314 uses the parallel combination of the external fixed resistor and the internal termination as the input impedance. See Figure 5 for a typical connection diagram using the external fixed resistor.

NOTE: Without the external resistor, the XRT83L314 meets all return loss specifications. This mode was created to add flexibility for optimizing return loss by using a high precision external resistor.

FIGURE 5. TYPICAL CONNECTION DIAGRAM USING ONE EXTERNAL FIXED RESISTOR
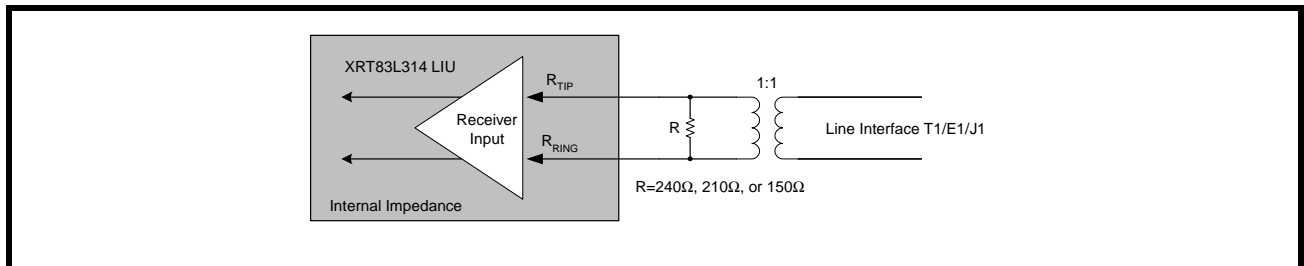

2.2   Equalizer Control

The main objective of the equalizer is to amplify an input attenuated signal to a pre-determined amplitude that is acceptable to the peak detector circuit. Using feedback from the peak detector, the equalizer will gain the input up to the maximum value specified by the equalizer control bits, in the appropriate channel register, normalizing the signal. Once the signal has reached the pre-determined amplitude, the signal is then processed within the peak detector and slicer circuit. A simplified block diagram of the equalizer and peak detector is shown in Figure 6.

FIGURE 6. SIMPLIFIED BLOCK DIAGRAM OF THE EQUALIZER AND PEAK DETECTOR
2.3   Cable Loss Indicator

The ability to monitor the cable loss attenuation of the receiver inputs is a valuable feature. The XRT83L314 contains a per channel, read only register for cable loss indication. CLOS[5:0] is a 6-Bit binary word that reports the value of cable loss in 1dB steps. An example of -25dB cable loss attenuation is shown in Figure 7.

FIGURE 7. SIMPLIFIED BLOCK DIAGRAM OF THE CABLE LOSS INDICATOR
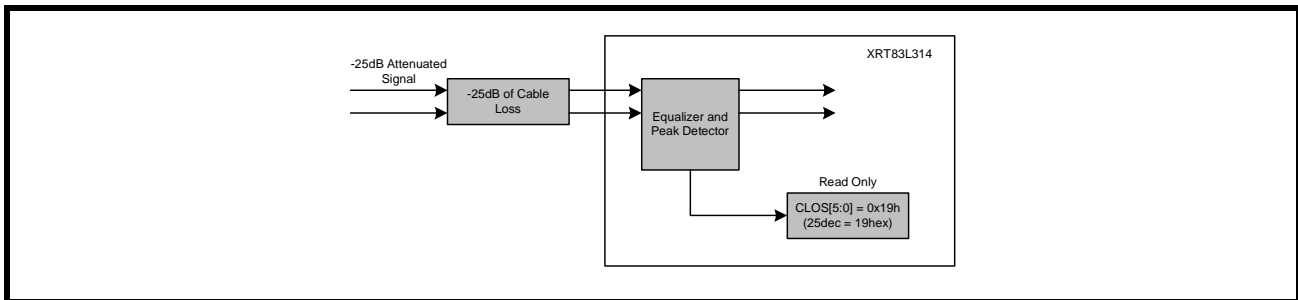

2.4   Equalizer Attenuation Flag

The ability to detect the amount of cable loss on the receiver inputs is enhanced by having the ability to generate an interrupt by programming a pre-determined value for cable loss into the EQFLAG[5:0] global register. This is particularly useful in long haul applications where it is necessary for the LIU to generate an interrupt for a cable loss which is lower than the declaration of the RLOS feature (see the RLOS section in this datasheet). If the contents of the EQFLAG[5:0] register bits are equal to or less than the contents in the cable loss indicator bits CLOS[5:0] for a given channel, an interrupt will be generated (if enabled in the appropriate channel register and GIE is to "1"). Using the same example in Figure 7, a simplified block diagram of the equalizer flag is shown in Figure 8.

FIGURE 8. SIMPLIFIED BLOCK DIAGRAM OF THE EQUALIZER ATTENUATION FLAG
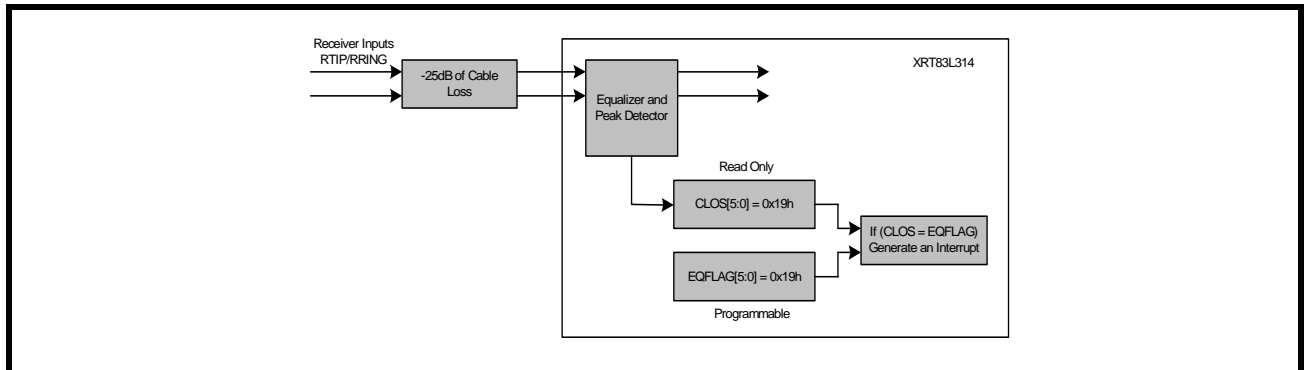

2.5   Peak Detector and Slicer

The peak detector provides feedback to the equalizer control circuit until the amplitude of the incoming signal is at an appropriate level. Once this level is obtained, the slicer identifies the incoming signal as a "1" and passes the raw data to the clock and data recovery circuit. The slicer threshold is selected by programming SL[1:0] in the appropriate global register. Selecting the slicer level is shown in Table 4.

TABLE 4: SELECTING THE SLICER LEVEL FOR THE PEAK DETECTOR

SL[1:0]	SLICER LEVEL
0h (00)	50%
1h (01)	45%
2h (10)	55%
3h (11)	68%

2.6   Clock and Data Recovery

The receive clock (RCLK) is recovered by the clock and data recovery circuitry. An internal PLL locks on the incoming data stream and outputs a clock that's in phase with the incoming signal. This allows for multi-channel T1/E1/J1 signals to arrive from different timing sources and remain independent. In the absence of an incoming signal, RCLK maintains its timing by using the internal master clock as its reference. The recovered data can be updated on either edge of RCLK. By default, data is updated on the rising edge of RCLK. To update data on the falling edge of RCLK, set RCLKE to "1" in the appropriate global register. Figure 9 is a timing diagram of the receive data updated on the rising edge of RCLK. Figure 10 is a timing diagram of the receive data updated on the falling edge of RCLK. The timing specifications are shown in Table 5.

FIGURE 9. RECEIVE DATA UPDATED ON THE RISING EDGE OF RCLK
FIGURE 10. RECEIVE DATA UPDATED ON THE FALLING EDGE OF RCLK
TABLE 5: TIMING SPECIFICATIONS FOR RCLK/RPOS/RNEG

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS
RCLK Duty Cycle	R_{CDU}	45	50	55	%
Receive Data Setup Time	R_{SU}	150	-	-	ns
Receive Data Hold Time	R_{HO}	150	-	-	ns
RCLK to Data Delay	R_{DY}	-	-	40	ns
RCLK Rise Time (10% to 90%) with 25pF Loading	$RCLK_R$	-	-	40	ns
RCLK Fall Time (90% to 10%) with 25pF Loading	$RCLK_F$	-	-	40	ns

NOTE: *VDD=3.3V ±5%, T_A=25°C, Unless Otherwise Specified*

2.6.1   Receive Sensitivity

To meet Long Haul receive sensitivity requirements, the XRT83L314 can accept T1/E1/J1 signals that have been attenuated by 43dB cable attenuation in E1 mode or 36dB cable attenuation in T1 mode without experiencing bit errors, LOF, pattern synchronization, etc. Short haul specifications are for 12dB of flat loss in E1 mode. T1 specifications are 655 feet of cable loss along with 6dB of flat loss in T1 mode. The XRT83L314 can tolerate cable loss and flat loss beyond the industry specifications. The receive sensitivity in the short haul mode is approximately 4,000 feet without experiencing bit errors, LOF, pattern synchronization, etc. Although data integrity is maintained, the RLOS function (if enabled) will report an RLOS condition according to the receiver loss of signal section in this datasheet. The test configuration for measuring the receive sensitivity is shown in Figure 11.

FIGURE 11. TEST CONFIGURATION FOR MEASURING RECEIVE SENSITIVITY
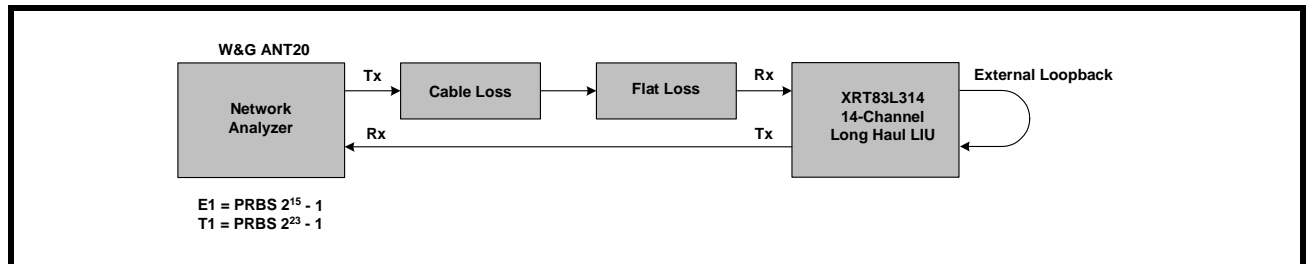

2.6.2   Interference Margin

The interference margin for the XRT83L314 will be added when the first revision of silicon arrives. The test configuration for measuring the interference margin is shown in Figure 12.

FIGURE 12. TEST CONFIGURATION FOR MEASURING INTERFERENCE MARGIN
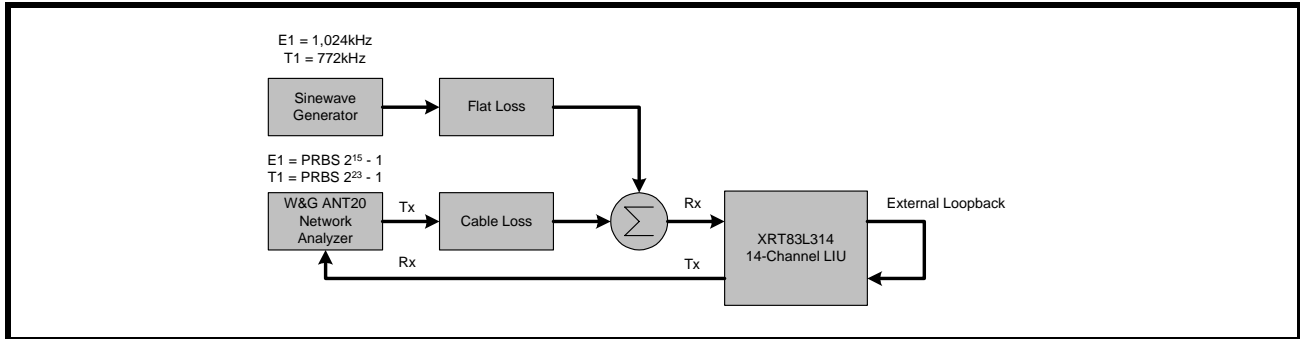

2.6.3   General Alarm Detection and Interrupt Generation

The receive path detects EQFLAG, RLOS, AIS, QRPD, NCLD, and FLS. These alarms can be individually masked to prevent the alarm from triggering an interrupt. To enable interrupt generation, the Global Interrupt Enable (GIE) bit must be set "High" in the appropriate global register. Any time a change in status occurs (it the alarms are enabled), the interrupt pin will pull "Low" to indicate an alarm has occurred. Once the status registers have been read, the INT pin will return "High". The status registers are Reset Upon Read (RUR). The interrupts are categorized in a hierarchical process block. Figure 13 is a simplified block diagram of the interrupt generation process.

FIGURE 13. INTERRUPT GENERATION PROCESS BLOCK
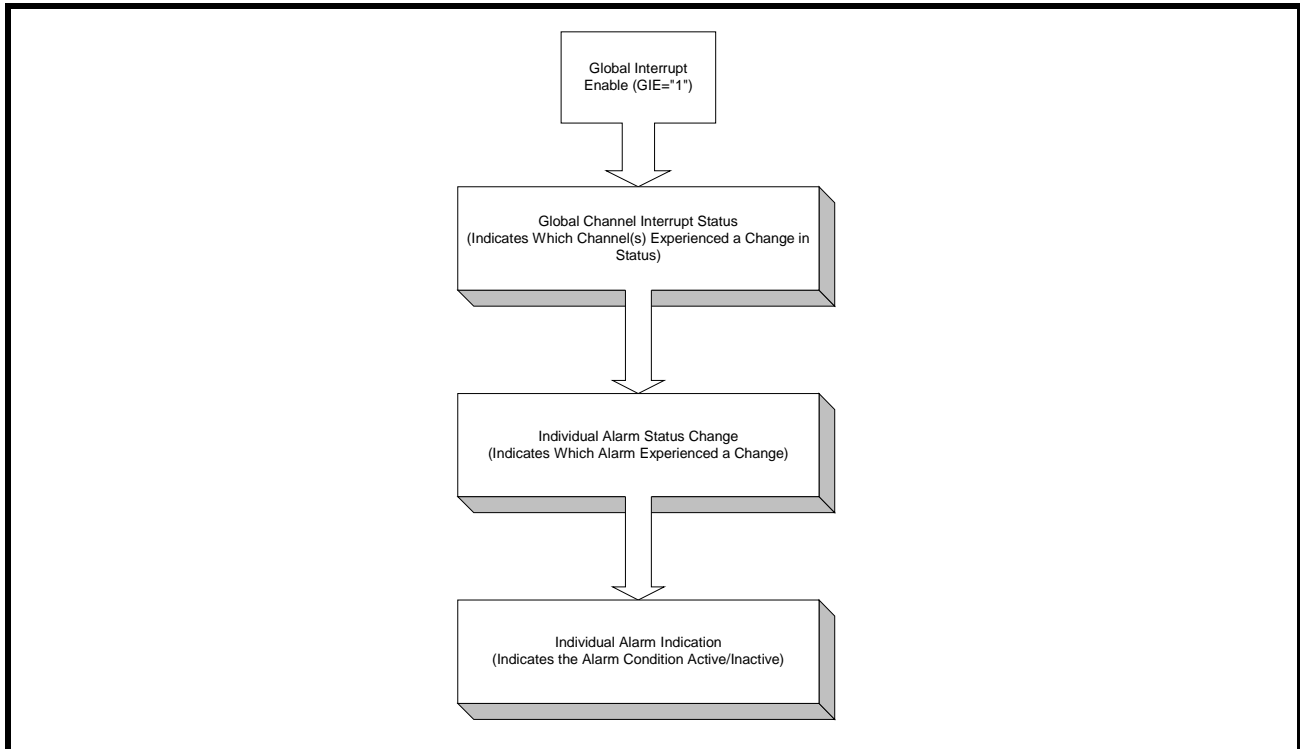

NOTE: The interrupt pin is an open-drain output that requires a 10kΩ external pull-up resistor.

2.6.3.1   RLOS (Receiver Loss of Signal)

In T1 mode, RLOS is declared if an incoming signal has no transitions over a period of 175 +/-75 contiguous pulse intervals. However, the XRT83L314 LIU has a built in analog RLOS so that the user can be notified when the amplitude of the incoming signal has been attenuated -9dB below the equalizer gain setting. For example: In T1 or E1 short haul mode, the equalizer gain setting is 15dB. Once the input reaches an amplitude of -24dB below nominal, the LIU will declare RLOS. The RLOS circuitry clears when the input reaches +3dB relative to where it was declared. This +3dB value is a pre-determined hysteresis so that transients will not cause the RLOS to clear. In E1 mode, RLOS is declared if an incoming signal has no transitions for N consecutive pulse intervals, where $10 \leq N \leq 255$. According to G.775, no transitions in E1 mode is defined between -9dB and -35dB below nominal. Figure 14 is a simplified block diagram of the analog RLOS function. Table 6 summarizes the analog RLOS values for the different equalizer gain settings.

FIGURE 14. ANALOG RECEIVE LOS OF SIGNAL FOR T1/E1/J1
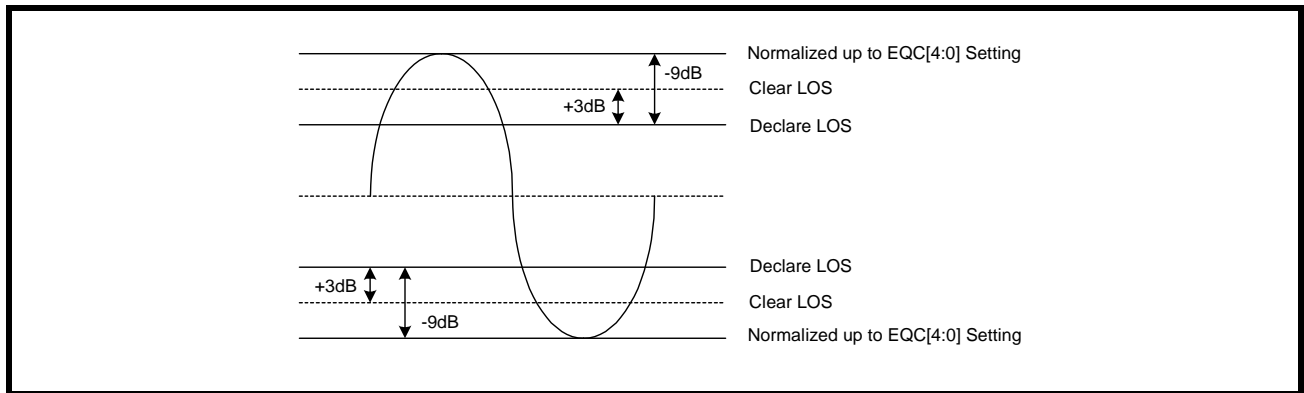

TABLE 6: ANALOG RLOS DECLARE/CLEAR (TYPICAL VALUES) FOR T1/E1

GAIN SETTING	DECLARE	CLEAR
15dB (Short Haul Mode)	-24dB	-21dB
29dB (Monitoring Gain Mode)	-38dB	-35dB
36dB (Long Haul Mode)	-45dB	-42dB
45dB (Long Haul Mode)	-54dB	-51dB

NOTE: For programming the equalizer gain setting on a per channel basis, see the microprocessor register map for details.

2.6.3.2   EXLOS (Extended Loss of Signal)

By enabling the extended loss of signal by programming the appropriate channel register, the digital RLOS is extended to count 4,096 consecutive zeros before declaring RLOS in T1 and E1 mode. By default, EXLOS is disabled and RLOS operates in normal mode.

2.6.3.3   AIS (Alarm Indication Signal)

The XRT83L314 adheres to the ITU-T G.775 specification for an all ones pattern. The alarm indication signal is set to "1" if an all ones pattern (at least 99.9% ones density) is present for T, where T is 3ms to 75ms in T1 mode. AIS will clear when the ones density is not met within the same time period T. In E1 mode, the AIS is set to "1" if the incoming signal has 2 or less zeros in a 512-bit window. AIS will clear when the incoming signal has 3 or more zeros in the 512-bit window.

2.6.3.4   NLCD (Network Loop Code Detection)

The Network Loop Code Detection can be programmed to detect a Loop-Up, Loop-Down, or Automatic Loop Code. If the network loop code detection is programmed for Loop-Up, the NLCD will be set "High" if a repeating pattern of "00001" occurs for more than 5 seconds. If the network loop code detection is programmed for Loop-Down, the NLCD will be set "High" if a repeating pattern of "001" occurs for more than 5

seconds. If the network loop code detection is programmed for automatic loop code, the LIU is configured to detect a Loop-Up code. If a Loop-Up code is detected for more than 5 seconds, the XRT83L314 will automatically program the channel into a remote loopback mode. The LIU will remain in remote loopback even if the Loop-Up code disappears. The channel will continue in remote loop back until a Loop-Down code is detected for more than 5 seconds (or, if the automatic loop code is disabled) and then automatically return to normal operation with no loop back. The process of the automatic loop code detection is shown in Figure 15.

FIGURE 15. PROCESS BLOCK FOR AUTOMATIC LOOP CODE DETECTION
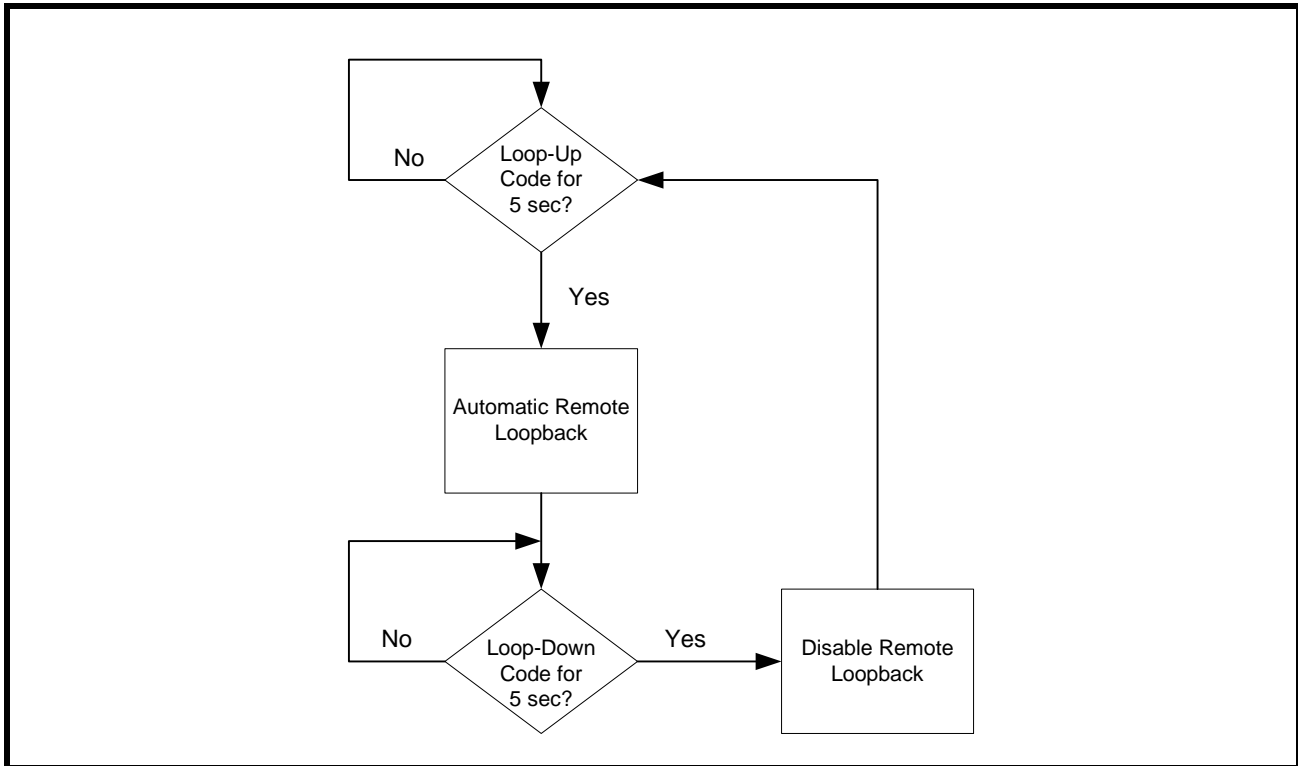

2.6.3.5 FLSD (FIFO Limit Status Detection)

The purpose of the FIFO limit status is to indicate when the Read and Write FIFO pointers are within a pre-determined range (over-flow or under-flow indication). The FLSD is set to "1" if the FIFO Read and Write Pointers are within ±3-Bits.

2.6.3.6 LCV/OFD (Line Code Violation / Counter Overflow Detection)

The LIU contains 14 independent, 16-bit LCV counters. When the counters reach full-scale, they remain saturated at FFFFh until they are reset globally or on a per channel basis. For performance monitoring, the counters can be updated globally or on a per channel basis to place the contents of the counters into holding registers. The LIU uses an indirect address bus to access a counter for a given channel. Once the contents of the counters have been placed in the holding registers, they can be individually read out from register 0xE8h 8-bits at a time according to the BYTEsel bit in the appropriate global register. By default, the LSB is placed in register 0xE8h until the BYTEsel is pulled "High" where upon the MSB will be placed in the register for read back. Once both bytes have been read, the next channel may be selected for read back.

By default, The LCV/OFD will be set to a "1" if the receiver is currently detecting line code violations or excessive zeros for HDB3 (E1 mode) or B8ZS (T1 mode). In AMI mode, the LCVD will be set to a "1" if the receiver is currently detecting bipolar violations or excessive zeros. However, if the LIU is configured to monitor the 16-bit LCV counter by programming the appropriate global register, the LCV/OFD will be set to a "1" if the counter saturates.

2.7 Receive Jitter Attenuator

The receive path has a dedicated jitter attenuator that reduces phase and frequency jitter in the recovered clock. The jitter attenuator uses a data FIFO (First In First Out) with a programmable depth of 32-bit or 64-bit. If the LIU is used for line synchronization (loop timing systems), the JA should be enabled. When the Read and Write pointers of the FIFO are within 2-Bits of over-flowing or under-flowing, the bandwidth of the jitter attenuator is widened to track the short term input jitter, thereby avoiding data corruption. When this condition occurs, the jitter attenuator will not attenuate input jitter until the Read/Write pointer's position is outside the 2-Bit window. In T1 mode, the bandwidth of the JA is always set to 3Hz. In E1 mode, the bandwidth is programmable to either 10Hz or 1.5Hz (1.5Hz automatically selects the 64-Bit FIFO depth). The JA has a clock delay equal to ½ of the FIFO bit depth.

NOTE: If the LIU is used in a multiplexer/mapper application where stuffing bits are typically removed, the transmit path has a dedicated jitter attenuator to smooth out the gapped clock. See the Transmit Section of this datasheet.

2.8 HDB3/B8ZS Decoder

In single rail mode, RPOS can decode AMI or HDB3/B8ZS signals. For E1 mode, HDB3 is defined as any block of 4 successive zeros replaced with OOOV or BOOV, so that two successive V pulses are of opposite polarity to prevent a DC component. In T1 mode, 8 successive zeros are replaced with OOOVBOVB. If the HDB3/B8ZS decoder is selected, the receive path removes the V and B pulses so that the original data is output to RPOS.

2.9   RPOS/RNEG/RCLK

The digital output data can be programmed to either single rail or dual rail formats. Figure 16 is a timing diagram of a repeating "0011" pattern in single-rail mode. Figure 17 is a timing diagram of the same fixed pattern in dual rail mode.

FIGURE 16. SINGLE RAIL MODE WITH A FIXED REPEATING "0011" PATTERN
FIGURE 17. DUAL RAIL MODE WITH A FIXED REPEATING "0011" PATTERN
2.10   RxMUTE (Receiver LOS with Data Muting)

The receive muting function can be selected by setting RxMUTE to "1" in the appropriate global register. If selected, any channel that experiences an RLOS condition will automatically pull RPOS and RNEG "Low" to prevent data chattering. If RLOS does not occur, the RxMUTE will remain inactive until an RLOS on a given channel occurs. The default setting for RxMUTE is "0" which is disabled. A simplified block diagram of the RxMUTE function is shown in Figure 18.

FIGURE 18. SIMPLIFIED BLOCK DIAGRAM OF THE RxMUTE FUNCTION
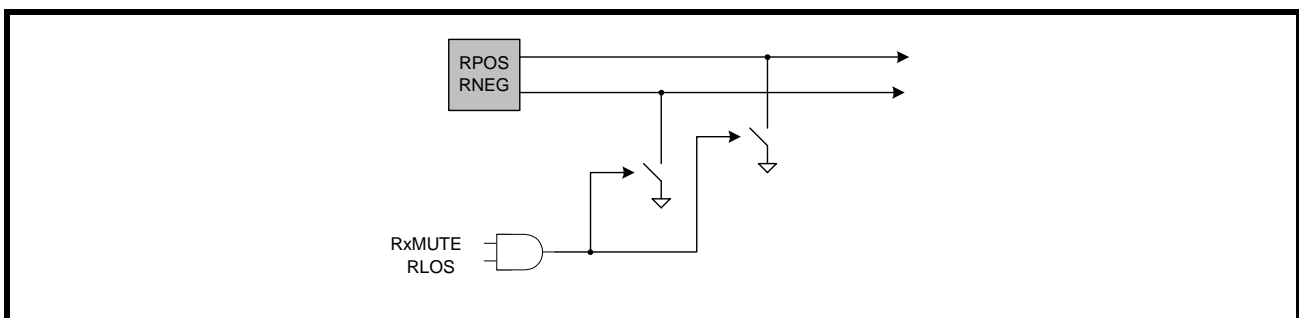

3.0 TRANSMIT PATH LINE INTERFACE

The transmit path of the XRT83L314 LIU consists of 14 independent T1/E1/J1 transmitters. The following section describes the complete transmit path from TCLK/TPOS/TNEG inputs to TTIP/TRING outputs. A simplified block diagram of the transmit path is shown in Figure 19.

FIGURE 19. SIMPLIFIED BLOCK DIAGRAM OF THE TRANSMIT PATH
3.1 TCLK/TPOS/TNEG Digital Inputs

In dual rail mode, TPOS and TNEG are the digital inputs for the transmit path. In single rail mode, TNEG has no function and can be left unconnected. The XRT83L314 can be programmed to sample the inputs on either edge of TCLK. By default, data is sampled on the falling edge of TCLK. To sample data on the rising edge of TCLK, set TCLKE to "1" in the appropriate global register. Figure 20 is a timing diagram of the transmit input data sampled on the falling edge of TCLK. Figure 21 is a timing diagram of the transmit input data sampled on the rising edge of TCLK. The timing specifications are shown in Table 7.

FIGURE 20. TRANSMIT DATA SAMPLED ON FALLING EDGE OF TCLK
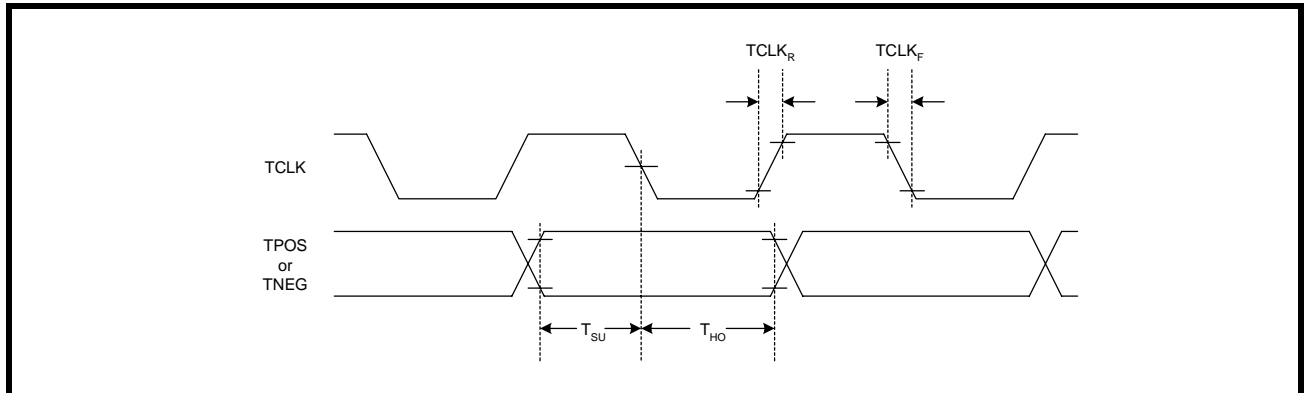

FIGURE 21. TRANSMIT DATA SAMPLED ON RISING EDGE OF TCLK
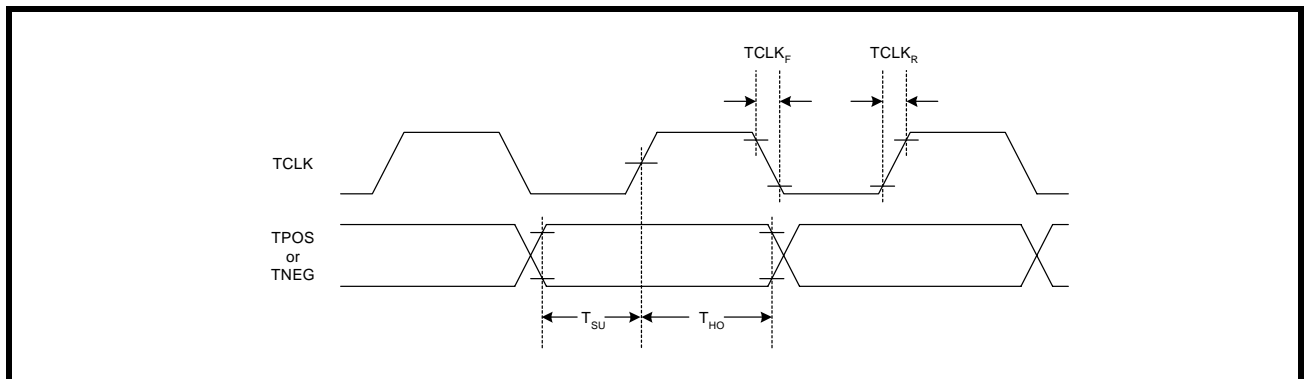

TABLE 7: TIMING SPECIFICATIONS FOR TCLK/TPOS/TNEG

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS
TCLK Duty Cycle	T_{CDU}	30	50	70	%
Transmit Data Setup Time	T_{SU}	50	-	-	ns
Transmit Data Hold Time	T_{HO}	30	-	-	ns
TCLK Rise Time (10% to 90%)	$TCLK_R$	-	-	40	ns
TCLK Fall Time (90% to 10%)	$TCLK_F$	-	-	40	ns

NOTE: *VDD=3.3V ±5%, T_A=25°C, Unless Otherwise Specified*

3.2 HDB3/B8ZS Encoder

In single rail mode, the LIU can encode the TPOS input signal to AMI or HDB3/B8ZS data. In E1 mode and HDB3 encoding selected, any sequence with four or more consecutive zeros in the input will be replaced with 000V or B00V, where "B" indicates a pulse conforming to the bipolar rule and "V" representing a pulse violating the rule. An example of HDB3 encoding is shown in Table 8. In T1 mode and B8ZS encoding selected, an input data sequence with eight or more consecutive zeros will be replaced using the B8ZS encoding rule. An example with Bipolar with 8 Zero Substitution is shown in Table 9.

TABLE 8: EXAMPLES OF HDB3 ENCODING

	NUMBER OF PULSES BEFORE NEXT 4 ZEROS	
Input		0000
HDB3 (Case 1)	Odd	000V
HDB3 (Case 2)	Even	B00V

TABLE 9: EXAMPLES OF B8ZS ENCODING

CASE 1	PRECEDING PULSE	NEXT 8 BITS
Input	+	00000000

AMI Output	+	000+-0-+
Case 2		
Input	-	00000000
B8ZS		000VB0VB
AMI Output	-	000-+0+-

3.3 Transmit Jitter Attenuator

The XRT83L314 LIU is ideal for multiplexer or mapper applications where the network data crosses multiple timing domains. As the higher data rates are de-multiplexed down to T1 or E1 data, stuffing bits are typically removed which can leave gaps in the incoming data stream. The transmit path has a dedicated jitter attenuator with a 32-Bit or 64-Bit FIFO that is used to smooth the gapped clock into a steady T1 or E1 output. The maximum gap width of the 14-Channel LIU is shown in Table 10.

TABLE 10: MAXIMUM GAP WIDTH FOR MULTIPLEXER/MAPPER APPLICATIONS

FIFO DEPTH	MAXIMUM GAP WIDTH
32-Bit	20 UI
64-Bit	50 UI

NOTE: *If the LIU is used in a loop timing system, the receive path has a dedicated jitter attenuator. See the Receive Section of this datasheet.*

3.4 TAOS (Transmit All Ones)

The XRT83L314 has the ability to transmit all ones on a per channel basis by programming the appropriate channel register. This function takes priority over the digital data present on the TPOS/TNEG inputs. For example: If a fixed "0011" pattern is present on TPOS in single rail mode and TAOS is enabled, the transmitter will output all ones. In addition, if digital or dual loopback is selected, the data on the RPOS output will be equal to the data on the TPOS input. Figure 22 is a diagram showing the all ones signal at TTIP and TRING.

FIGURE 22. TAOS (TRANSMIT ALL ONES)
3.5 Transmit Diagnostic Features

In addition to TAOS, the XRT83L314 offers multiple diagnostic features for analyzing network integrity such as ATAOS, Network Loop Code generation, and QRSS on a per channel basis by programming the appropriate registers. These diagnostic features take priority over the digital data present on TPOS/TNEG inputs. The transmitters will send the diagnostic code to the line and will be maintained in the digital loopback if selected. When the LIU is responsible for sending diagnostic patterns, the LIU is automatically placed in the single rail mode.

3.5.1   ATAOS (Automatic Transmit All Ones)

If ATAOS is selected by programming the appropriate global register, an AMI all ones signal will be transmitted for each channel that experiences an RLOS condition. If RLOS does not occur, the ATAOS will remain inactive until an RLOS on a given channel occurs. A simplified block diagram of the ATAOS function is shown in Figure 23.

FIGURE 23. SIMPLIFIED BLOCK DIAGRAM OF THE ATAOS FUNCTION
3.5.2   Network Loop Up Code

By setting the LIU to generate a NLUC, the transmitters will send out a repeating "00001" pattern. The output waveform is shown in Figure 24.

FIGURE 24. NETWORK LOOP UP CODE GENERATION
3.5.3   Network Loop Down Code

By setting the LIU to generate a NLDC, the transmitters will send out a repeating "001" pattern. The output waveform is shown in Figure 25.

FIGURE 25. NETWORK LOOP DOWN CODE GENERATION
3.5.4   QRSS Generation

The XRT83L314 can transmit a QRSS random sequence to a remote location from TTIP/TRING. The polynomial is shown in Table 11.

TABLE 11: RANDOM BIT SEQUENCE POLYNOMIALS

RANDOM PATTERN	T1	E1
QRSS	$2^{20} - 1$	$2^{15} - 1$

3.6   Transmit Pulse Shaper and Filter

If TCLK is not present, pulled "Low", or pulled "High" the transmitter outputs at TTIP/TRING will automatically send an all ones or an all zero signal to the line by programming the appropriate global register. By default, the transmitters will send all zeros. To send all ones, the TCLKCNL bit must be set "High".

3.6.1   T1 Long Haul Line Build Out (LBO)

The long haul transmitter output pulses are generated using a 7-Bit internal DAC (6-Bits plus the MSB sign bit). The line build out can be set to -7.5dB, -15dB, or -22dB cable attenuation by programming the appropriate channel register. The long haul LBO consist of 32 discrete time segments extending over four consecutive periods of TCLK. As the LBO attenuation is increased, the pulse amplitude is reduced so that the waveform complies with ANSI T1.403 specifications. A long haul pulse with -7.5dB attenuation is shown in Figure 26, a pulse with -15dB attenuation is shown in Figure 27, and a pulse with -22.5dB attenuation is shown in Figure 28.

FIGURE 26. LONG HAUL LINE BUILD OUT WITH -7.5DB ATTENUATION
FIGURE 27. LONG HAUL LINE BUILD OUT WITH -15DB ATTENUATION
FIGURE 28. LONG HAUL LINE BUILD OUT WITH -22.5DB ATTENUATION
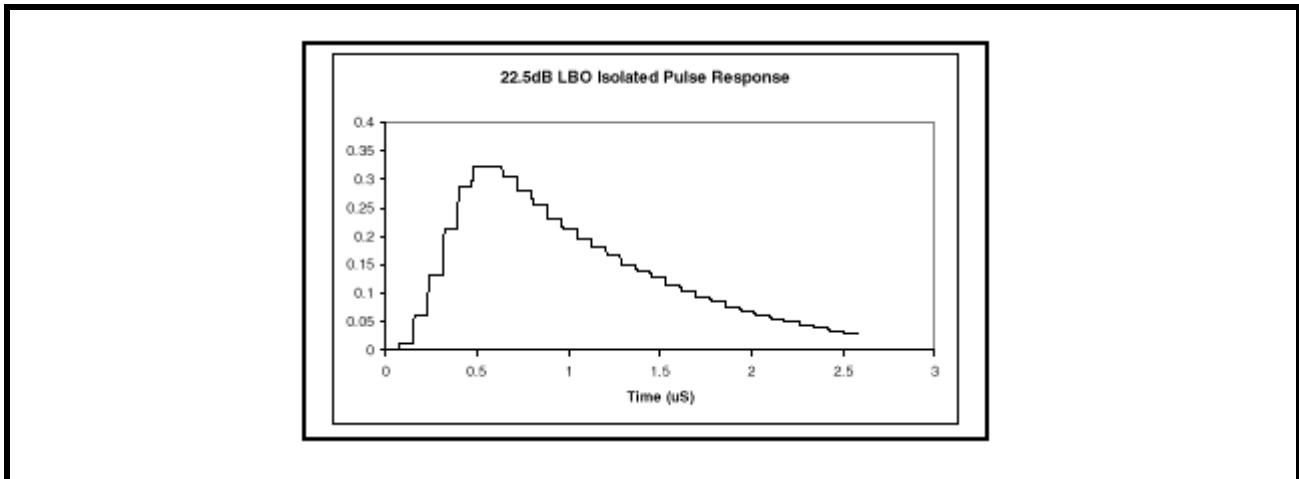

3.6.2 T1 Short Haul Line Build Out (LBO)

The short haul transmitter output pulses are generated using a 7-Bit internal DAC (6-Bit plus the MSB sign bit). The line build out can be set to interface to five different ranges of cable attenuation by programming the appropriate channel register. The pulse shape is divided into eight discrete time segments which are set to fixed values to comply with the pulse template. To program the eight segments individually to optimize a special line build out, see the arbitrary pulse section of this datasheet. The short haul LBO settings are shown in Table 12

TABLE 12: SHORT HAUL LINE BUILD OUT

LBO SETTING EQC[4:0]	RANGE OF CABLE ATTENUATION
08h (01000)	0 - 133 Feet
09h (01001)	133 - 266 Feet
0Ah (01010)	266 - 399 Feet
0Bh (01011)	399 - 533 Feet
0Ch (01100)	533 - 655 Feet

3.6.3 Arbitrary Pulse Generator For T1 and E1

The arbitrary pulse generator divides the pulse into eight individual segments. Each segment is set by a 7-Bit binary word by programming the appropriate channel register. This allows the system designer to set the overshoot, amplitude, and undershoot for a unique line build out. The MSB (bit 7) is a sign-bit. If the sign-bit is set to "0", the segment will move in a positive direction relative to a flat line (zero) condition. If this sign-bit is set to "1", the segment will move in a negative direction relative to a flat line condition. The resolution of the DAC is typically 60mV per LSB. Thus, writing 7-bit = 1111111 will clamp the output at either voltage rail corresponding to a maximum amplitude. A pulse with numbered segments is shown in Figure 29.

FIGURE 29. ARBITRARY PULSE SEGMENT ASSIGNMENT

Segment	Register
1	0xn8
2	0xn9
3	0xna
4	0xnb
5	0xnc
6	0xnd
7	0xne
8	0xnf
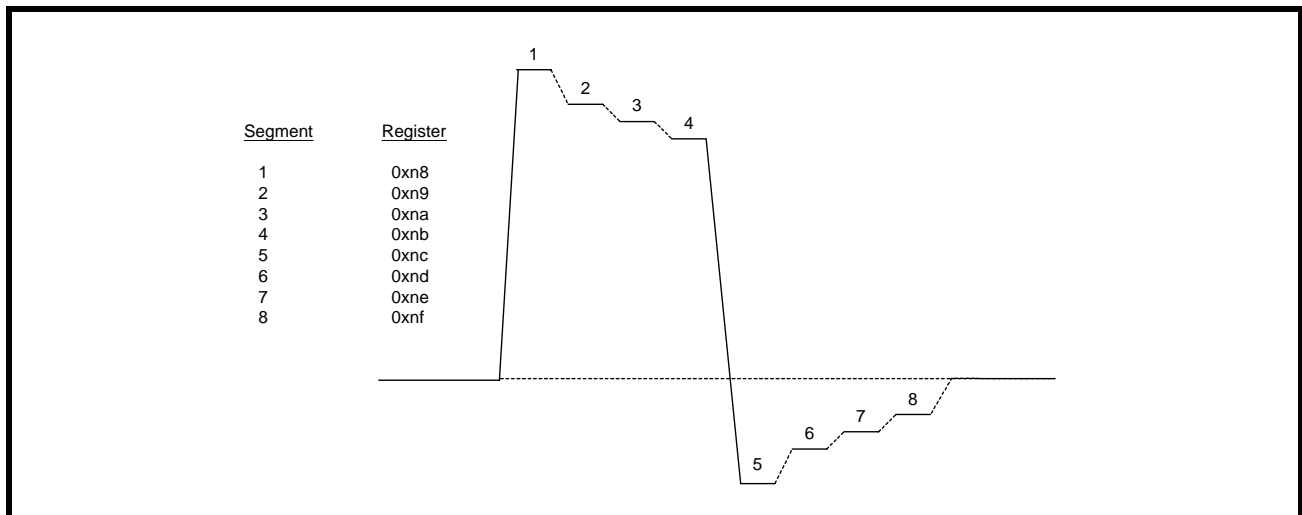

NOTE: *By default, the arbitrary segments are programmed to 0x00h. The transmitter outputs will result in an all zero pattern to the line interface.*

3.7 DMO (Digital Monitor Output)

The driver monitor circuit is used to detect transmit driver failures by monitoring the activities at TTIP/TRING outputs. Driver failure may be caused by a short circuit in the primary transformer or system problems at the transmit inputs. If the transmitter of a channel has no output for more than 128 clock cycles, DMO goes "High" until a valid transmit pulse is detected. If the DMO interrupt is enabled, the change in status of DMO will cause

the interrupt pin to go "Low". Once the status register is read, the interrupt pin will return "High" and the status register will be reset (RUR).

3.8 Line Termination (TTIP/TRING)

The output stage of the transmit path generates standard return-to-zero (RZ) signals to the line interface for T1/E1/J1 twisted pair or E1 coaxial cable. The physical interface is optimized by placing the terminating impedance inside the LIU. This allows one bill of materials for all modes of operation reducing the number of external components necessary in system design. The transmitter outputs only require one DC blocking capacitor of $0.68\mu F$. For redundancy applications (or simply to tri-state the transmitters), set TxTSEL to a "1" in the appropriate channel register. A typical transmit interface is shown in Figure 30.

FIGURE 30. TYPICAL CONNECTION DIAGRAM USING INTERNAL TERMINATION
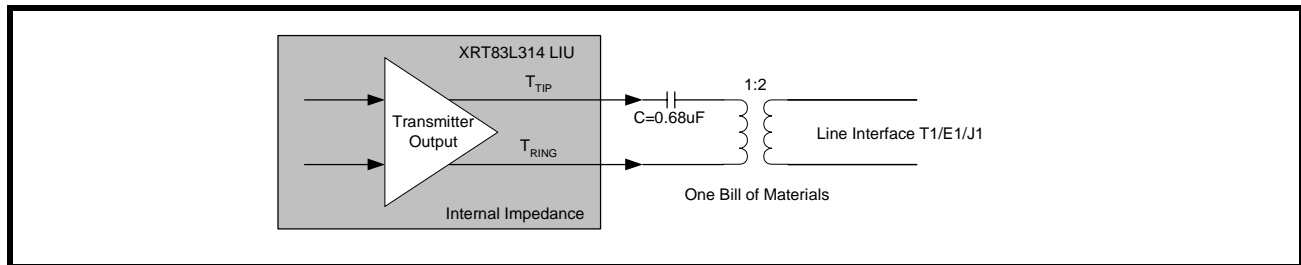

4.0 T1/E1 APPLICATIONS

This applications section describes common T1/E1 system considerations along with references to application notes available for reference where applicable.

4.1 Loopback Diagnostics

The XRT83L314 supports several loopback modes for diagnostic testing. The following section describes the local analog loopback, remote loopback, digital loopback, and dual loopback modes.

4.1.1 Local Analog Loopback

With local analog loopback activated, the transmit output data at TTIP/TRING is internally looped back to the analog inputs at RTIP/RRING. External inputs at RTIP/RRING are ignored while valid transmit output data continues to be sent to the line. A simplified block diagram of local analog loopback is shown in Figure 31.

FIGURE 31. SIMPLIFIED BLOCK DIAGRAM OF LOCAL ANALOG LOOPBACK
NOTE: *The transmit diagnostic features such as TAOS, NLC generation, and QRSS take priority over the transmit input data at TCLK/TPOS/TNEG.*

4.1.2 Remote Loopback

With remote loopback activated, the receive input data at RTIP/RRING is internally looped back to the transmit output data at TTIP/TRING. The remote loopback includes the Receive JA (if enabled). The transmit input data at TCLK/TPOS/TNEG are ignored while valid receive output data continues to be sent to the system. A simplified block diagram of remote loopback is shown in Figure 32.

FIGURE 32. SIMPLIFIED BLOCK DIAGRAM OF REMOTE LOOPBACK
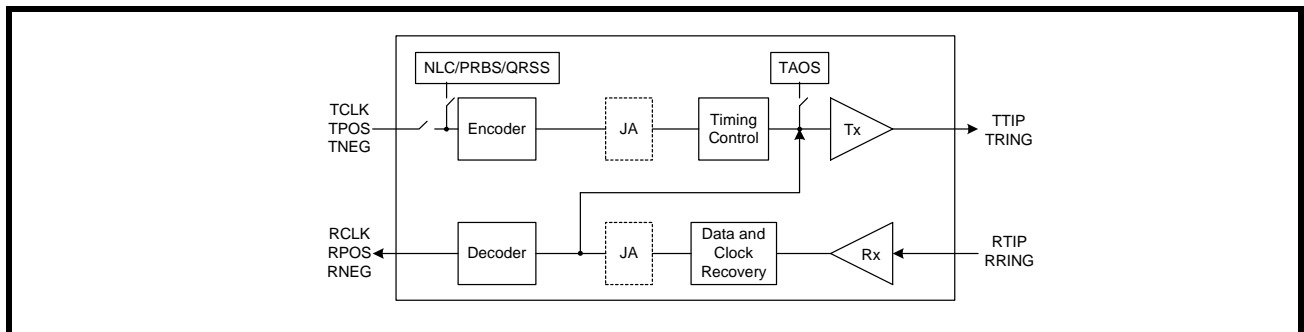

4.1.3 Digital Loopback

With digital loopback activated, the transmit input data at TCLK/TPOS/TNEG is looped back to the receive output data at RCLK/RPOS/RNEG. The digital loopback mode includes the Transmit JA (if enabled). The receive input data at RTIP/RRING is ignored while valid transmit output data continues to be sent to the line. A simplified block diagram of digital loopback is shown in Figure 33.

FIGURE 33. SIMPLIFIED BLOCK DIAGRAM OF DIGITAL LOOPBACK
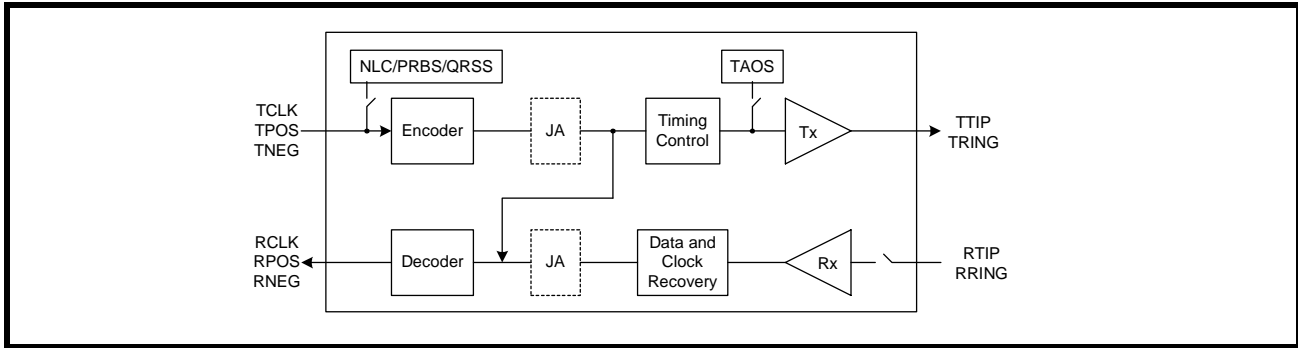

4.1.4 Dual Loopback

With dual loopback activated, the remote loopback is combined with the digital loopback. A simplified block diagram of dual loopback is shown in Figure 34.

FIGURE 34. SIMPLIFIED BLOCK DIAGRAM OF DUAL LOOPBACK
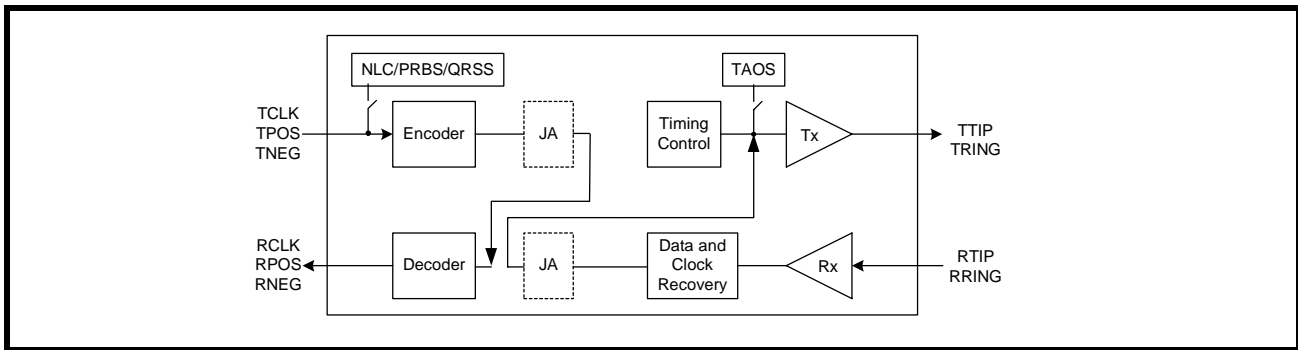

4.2   84-Channel T1/E1 Multiplexer/Mapper Applications

The XRT83L314 has the capability of providing the necessary chip selects for multiple 14-channel LIU devices. The LIU is responsible for selecting itself, up to 5 additional LIU devices, or all 6 devices simultaneously for permitting access to internal registers. The state of the chip select output pins is determined by a chip select decoder controlled by the 3 MSBs of the address bus ADDR[10:8]. Only one LIU (Master) requires the ADDR[10:8]. The other 5 LIU devices use the 8 LSBs for the direct address bus ADDR[7:0]. Figure 35 is a simplified block diagram of connecting six 14-channel LIU devices for 84-channel applications. Selection of the chip select outputs using ADDR[10:8] is shown in Table 13.

FIGURE 35. SIMPLIFIED BLOCK DIAGRAM OF AN 84-CHANNEL APPLICATION
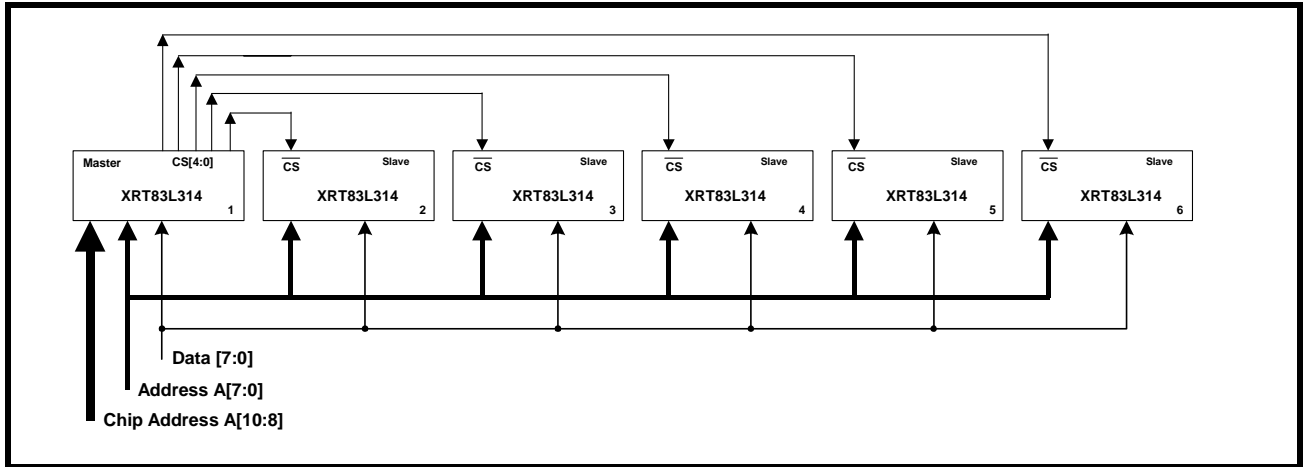

TABLE 13: CHIP SELECT ASSIGNMENTS

ADDR[10:8]	ACTIVE CHIP SELECT
0h (000)	Current Device (Master)
1h (001)	Chip 1
2h (010)	Chip 2
3h (011)	Chip 3
4h (100)	Chip 4
5h (101)	Chip 5
6h (110)	Reserved
7h (111)	All Devices Active

4.3   Line Card Redundancy

Telecommunication system design requires signal integrity and reliability. When a T1/E1 primary line card has a failure, it must be swapped with a backup line card while maintaining connectivity to a backplane without losing data. System designers can achieve this by implementing common redundancy schemes with the XRT83L314 LIU. EXAR offers features that are tailored to redundancy applications while reducing the number of components and providing system designers with solid reference designs.

RLOS and DMO

If an RLOS or DMO condition occurs, the XRT83L314 reports the alarm to the individual status registers on a per channel basis. However, for redundancy applications, an RLOS or DMO alarm can be used to initiate an automatic switch to the back up card. For this application, two global pins RLOS and DMO are used to indicate that one of the 14-channels has an RLOS or DMO condition.

Typical Redundancy Schemes

● 1:1 One backup card for every primary card (Facility Protection)

● 1+1 One backup card for every primary card (Line Protection)

● ·N+1 One backup card for N primary cards

4.3.1   1:1 and 1+1 Redundancy Without Relays

The 1:1 facility protection and 1+1 line protection have one backup card for every primary card. When using 1:1 or 1+1 redundancy, the backup card has its transmitters tri-stated and its receivers in high impedance. This eliminates the need for external relays and provides one bill of materials for all interface modes of operation. For 1+1 line protection, the receiver inputs on the backup card have the ability to monitor the line for bit errors while in high impedance. The transmit and receive sections of the LIU device are described separately.

4.3.2   Transmit Interface with 1:1 and 1+1 Redundancy

The transmitters on the backup card should be tri-stated. Select the appropriate impedance for the desired mode of operation, T1/E1/J1. A 0.68uF capacitor is used in series with TTIP for blocking DC bias. See Figure 36. for a simplified block diagram of the transmit section for a 1:1 and 1+1 redundancy.

FIGURE 36. SIMPLIFIED BLOCK DIAGRAM OF THE TRANSMIT INTERFACE FOR 1:1 AND 1+1 REDUNDANCY
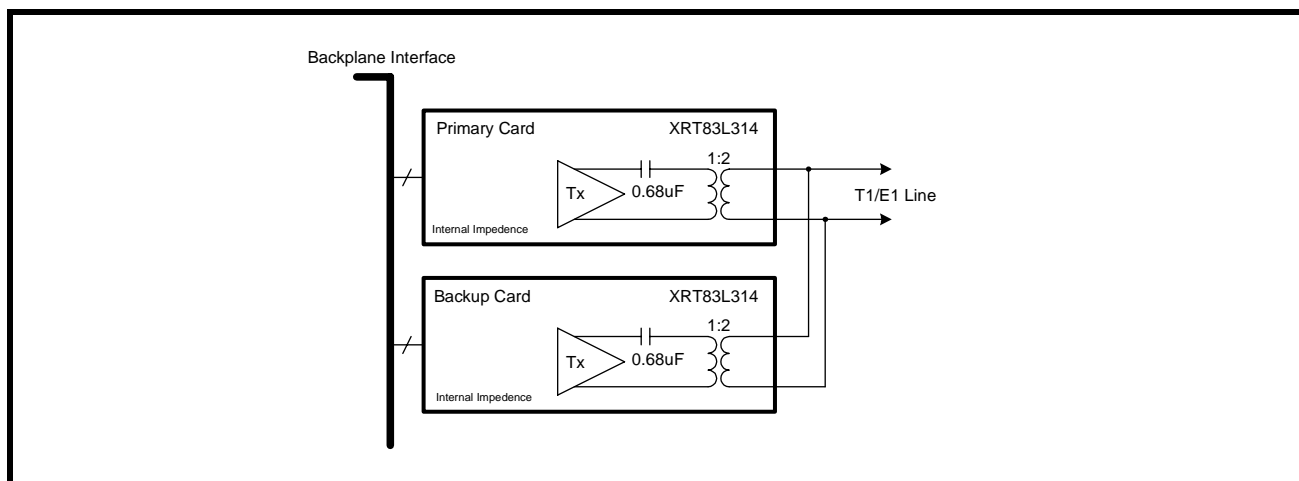

4.3.3   Receive Interface with 1:1 and 1+1 Redundancy

The receivers on the backup card should be programmed for "High" impedance. Since there is no external resistor in the circuit, the receivers on the backup card will not load down the line interface. This key design feature eliminates the need for relays and provides one bill of materials for all interface modes of operation. Select the impedance for the desired mode of operation, T1/E1/J1. To swap the primary card, set the backup

card to internal impedance, then the primary card to "High" impedance. See Figure 37. for a simplified block diagram of the receive section for a 1:1 redundancy scheme.

FIGURE 37. SIMPLIFIED BLOCK DIAGRAM OF THE RECEIVE INTERFACE FOR 1:1 AND 1+1 REDUNDANCY
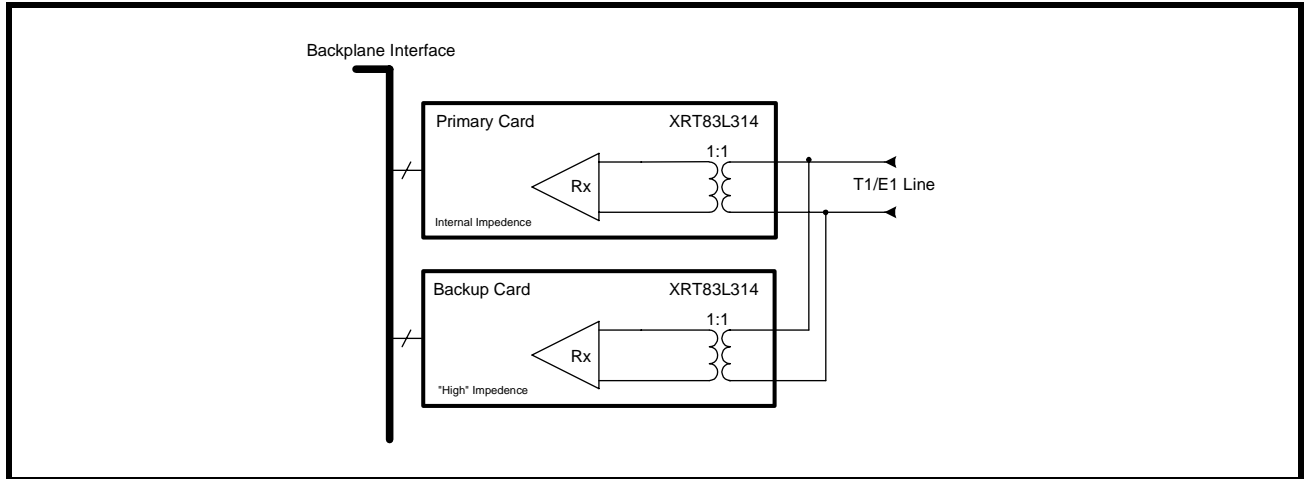

4.3.4   N+1 Redundancy Using External Relays

N+1 redundancy has one backup card for N primary cards. Due to impedance mismatch and signal contention, external relays are necessary when using this redundancy scheme. The relays create complete isolation between the primary cards and the backup card. This allows all transmitters and receivers on the primary cards to be configured in internal impedance, providing one bill of materials for all interface modes of operation. The transmit and receive sections of the LIU device are described separately.

4.3.5   Transmit Interface with N+1 Redundancy

For N+1 redundancy, the transmitters on all cards should be programmed for internal impedance.   The transmitters on the backup card do not have to be tri-stated.   To swap the primary card, close the desired relays, and tri-state the transmitters on the failed primary card.   A 0.68uF capacitor is used in series with TTIP for blocking DC bias.   See Figure 38 for a simplified block diagram of the transmit section for an N+1 redundancy scheme.

FIGURE 38. SIMPLIFIED BLOCK DIAGRAM OF THE TRANSMIT INTERFACE FOR N+1 REDUNDANCY
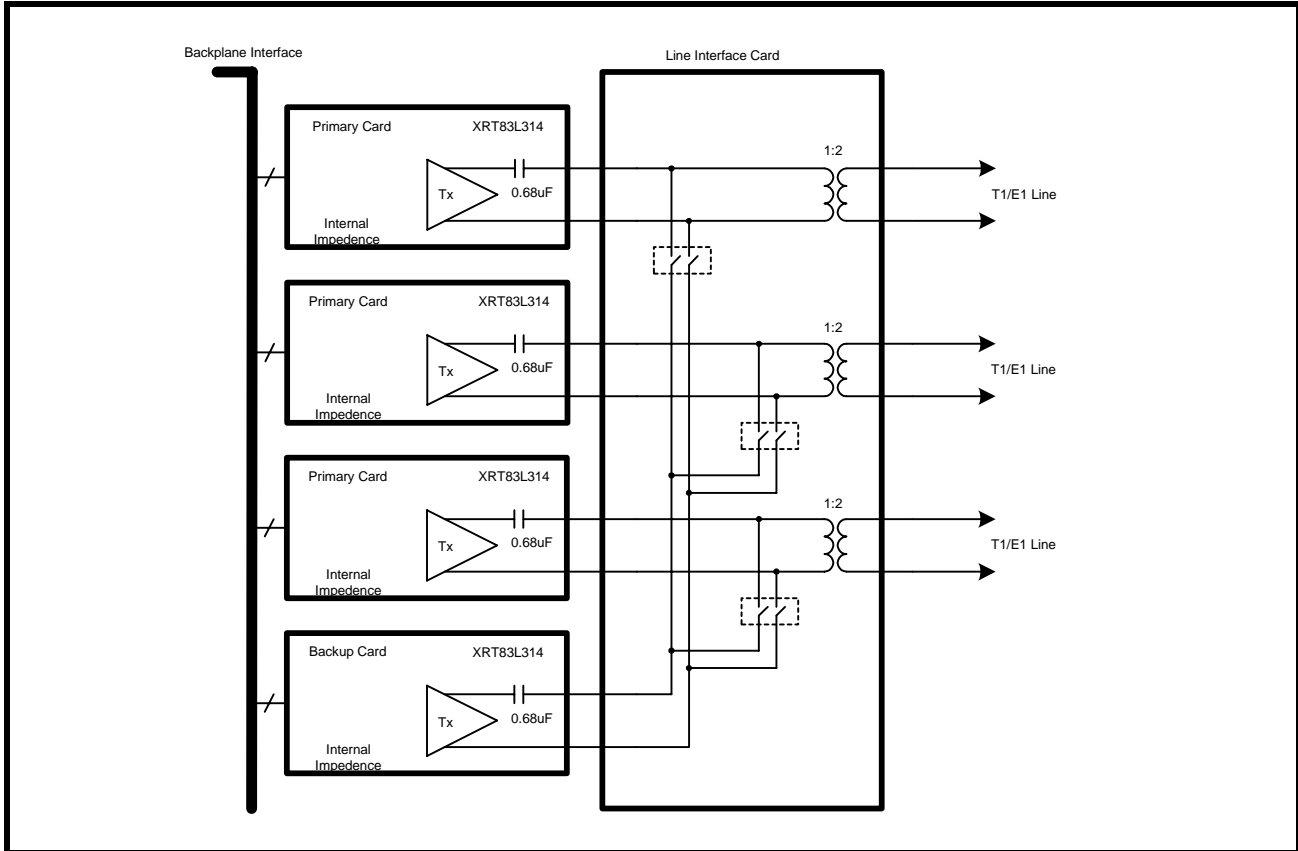

4.3.6   Receive Interface with N+1 Redundancy

For N+1 redundancy, the receivers on the primary cards should be programmed for internal impedance. The receivers on the backup card should be programmed for "High" impedance mode. To swap the primary card, set the backup card to internal impedance, then the primary card to "High" impedance. See Figure 39 for a simplified block diagram of the receive section for a N+1 redundancy scheme.

FIGURE 39. SIMPLIFIED BLOCK DIAGRAM OF THE RECEIVE INTERFACE FOR N+1 REDUNDANCY
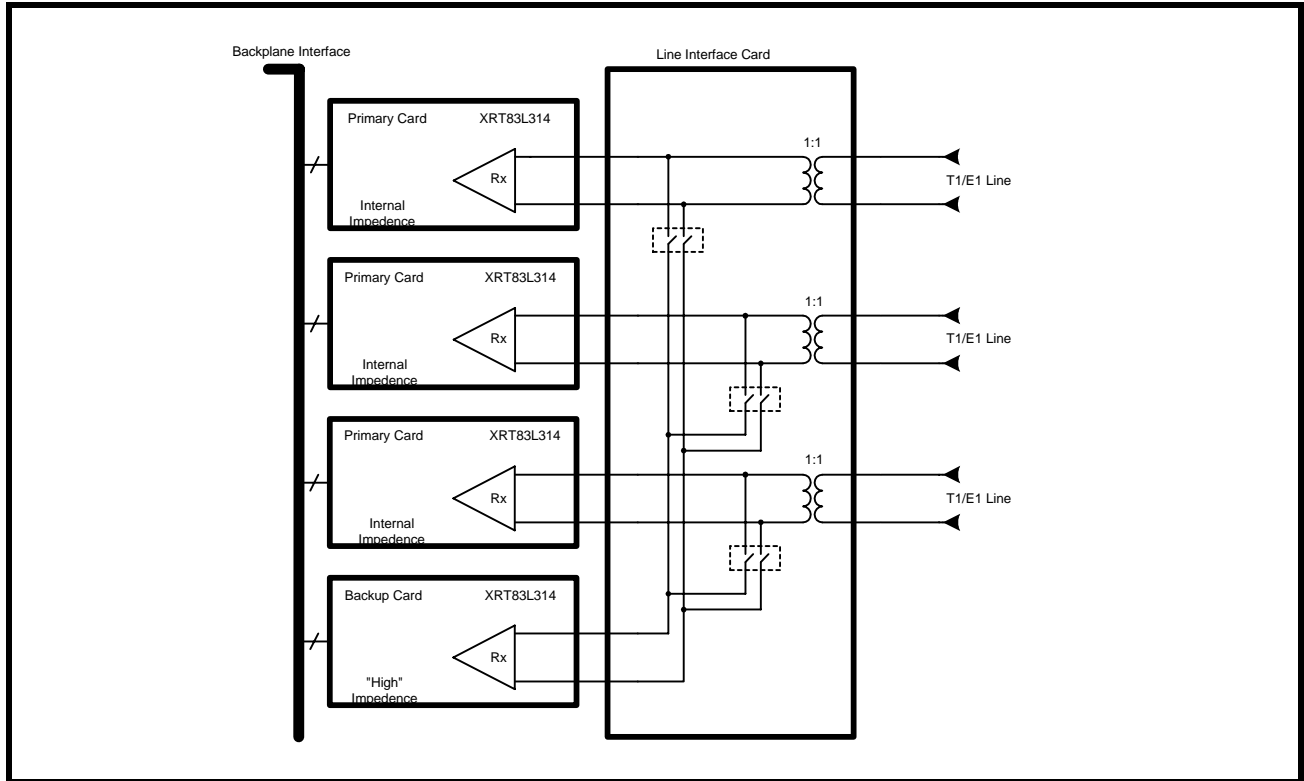

4.4   Power Failure Protection

For 1:1 or 1+1 line card redundancy in T1/E1 applications, power failure could cause a line card to change the characteristics of the line impedance, causing a degradation in system performance. The XRT83L314 was designed to ensure reliability during power failures. The LIU has patented high impedance circuits that allow the receiver inputs and the transmitter outputs to be in "High" impedance when the LIU experiences a power failure or when the LIU is powered off.

NOTE: For power failure protection, a transformer must be used to couple to the line interface. See the TAN-56 application note for more details.

4.5   Overvoltage and Overcurrent Protection

Physical layer devices such as LIUs that interface to telecommunications lines are exposed to overvoltage transients posed by environmental threats. An Overvoltage transient is a pulse of energy concentrated over a small period of time, usually under a few milliseconds. These pulses are random and exceed the operating conditions of CMOS transceiver ICs. Electronic equipment connecting to data lines are susceptible to many forms of overvoltage transients such as lightning, AC power faults and electrostatic discharge (ESD). There are three important standards when designing a telecommunications system to withstand overvoltage transients.

• UL1950 and FCC Part 68

• Telcordia (Bellcore) GR-1089

• ITU-T K.20, K.21 and K.41

NOTE: For a reference design and performance, see the TAN-54 application note for more details.

4.6   Non-Intrusive Monitoring

In non-intrusive monitoring applications, the transmitters are shut off by setting TxON "Low". The receivers must be actively receiving data without interfering with the line impedance. The XRT83L314's internal termination ensures that the line termination meets T1/E1 specifications for 75Ω, 100Ω or 120Ω while monitoring the data stream. System integrity is maintained by placing the non-intrusive receiver in "High" impedance, equivalent to that of a 1+1 redundancy application. A simplified block diagram of non-intrusive monitoring is shown in Figure 40.

FIGURE 40. SIMPLIFIED BLOCK DIAGRAM OF A NON-INTRUSIVE MONITORING APPLICATION
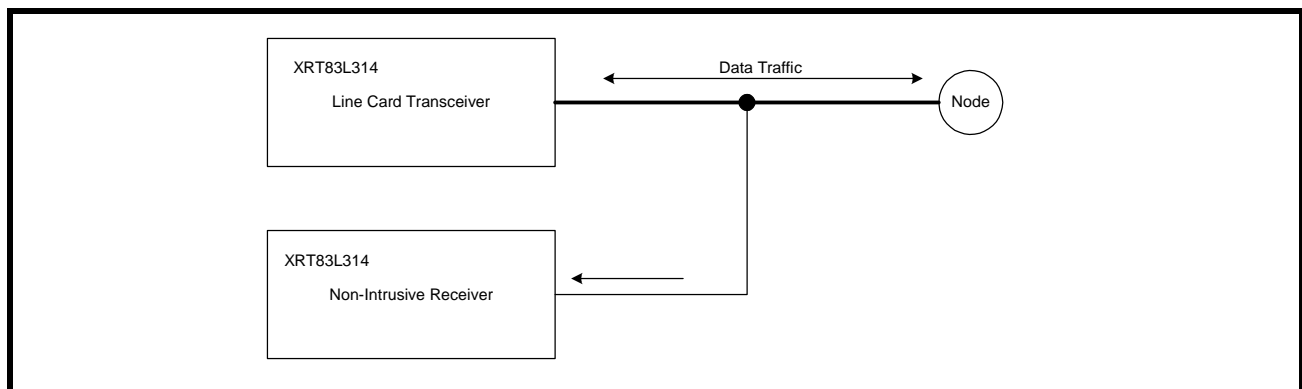

4.7   XRT83L314 Jitter Characteristics

There are three important jitter requirements for T1/E1 physical layer devices. Intrinsic Jitter, Jitter Transfer Characteristics, and Jitter Tolerance and Wander.

4.7.1   Intrinsic Jitter

The XRT83L314 exceeds the intrinsic jitter requirements for T1/E1 specifications. The intrinsic jitter of the 14-Channel LIU is typically 0.015 UI_{p-p}

4.7.2 Jitter Transfer Characteristics

To be Added When First Revision of Silicon Arrives.

4.7.3 Jitter Tolerance and Wander

To be Added When First Revision of Silicon Arrives.

4.8 Pulse Template

To be Added When First Revision of Silicon Arrives.

5.0 MICROPROCESSOR INTERFACE BLOCK

The Microprocessor Interface section supports communication between the local microprocessor (µP) and the LIU. The XRT83L314 supports an Intel asynchronous interface, Motorola 68K asynchronous, and a Motorola Power PC interface. The microprocessor interface is selected by the state of the µPTS[2:0] input pins. Selecting the microprocessor interface is shown in Table 14.

TABLE 14: SELECTING THE MICROPROCESSOR INTERFACE MODE

µPTS[2:0]	MICROPROCESSOR MODE
0h (000)	Intel 68HC11, 8051, 80C188 (Asynchronous)
1h (001)	Motorola 68K (Asynchronous)
7h (111)	Motorola MPC8260, MPC860 Power PC (Synchronous)

The XRT83L314 uses multipurpose pins to configure the device appropriately. The local µP configures the LIU by writing data into specific addressable, on-chip Read/Write registers. The microprocessor interface provides the signals which are required for a general purpose microprocessor to read or write data into these registers. The microprocessor interface also supports polled and interrupt driven environments. A simplified block diagram of the microprocessor is shown in Figure 41.

FIGURE 41. SIMPLIFIED BLOCK DIAGRAM OF THE MICROPROCESSOR INTERFACE BLOCK
5.1 THE MICROPROCESSOR INTERFACE BLOCK SIGNALS

The LIU may be configured into different operating modes and have its performance monitored by software through a standard microprocessor using data, address and control signals. These interface signals are described below in Table 15, Table 16, and Table 17. The microprocessor interface can be configured to operate in Intel mode or Motorola mode. When the microprocessor interface is operating in Intel mode, some of the control signals function in a manner required by the Intel 80xx family of microprocessors. Likewise, when the microprocessor interface is operating in Motorola mode, then these control signals function in a manner as required by the Motorola Power PC family of microprocessors. (For using a Motorola 68K asynchronous processor, see Figure 44 and Table 20) Table 15 lists and describes those microprocessor interface signals whose role is constant across the two modes. Table 16 describes the role of some of these signals when the microprocessor interface is operating in the Intel mode. Likewise, Table 17 describes the role of these signals when the microprocessor interface is operating in the Motorola mode.

TABLE 15: XRT84L314 MICROPROCESSOR INTERFACE SIGNALS THAT EXHIBIT CONSTANT ROLES IN BOTH INTEL AND MOTOROLA MODES

PIN NAME	TYPE	DESCRIPTION
µPTS[2:0]	I	**Microprocessor Interface Mode Select Input pins** These three pins are used to specify the microprocessor interface mode. The relationship between the state of these three input pins, and the corresponding microprocessor mode is presented in Table 14.
DATA[7:0]	I/O	**Bi-Directional Data Bus for register "Read" or "Write" Operations.**
ADDR[10:8]	I	**Three-Bit Address Bus Inputs** The 3 MSBs of the address bits are used as a chip select decoder. The state of these 3 pins enable the Chip Selects for additional LIU devices. *NOTE: See the 84-Channel Application Section of this datasheet.*
ADDR[7:0]	I	**Eight-Bit Address Bus Inputs** The XRT83L314 LIU microprocessor interface uses a direct address bus. This address bus is provided to permit the user to select an on-chip register for Read/Write access.
$\overline{CS}$	I	**Chip Select Input** This active low signal selects the microprocessor interface of the XRT83L314 LIU and enables Read/Write operations with the on-chip register locations.

TABLE 16: INTEL MODE: MICROPROCESSOR INTERFACE SIGNALS

XRT83L314 PIN NAME	INTEL EQUIVALENT PIN	TYPE	DESCRIPTION
ALE_TS	ALE	I	**Address-Latch Enable:** This active high signal is used to latch the contents on the address bus ADDR[7:0]. The contents of the address bus are latched into the ADDR[7:0] inputs on the falling edge of ALE.
$\overline{RD}$_$\overline{WE}$	$\overline{RD}$	I	**Read Signal:** This active low input functions as the read signal from the local µP. When this pin is pulled "Low" (if $\overline{CS}$ is "Low") the LIU is informed that a read operation has been requested and begins the process of the read cycle.
$\overline{WR}$_R/$\overline{W}$	$\overline{WR}$	I	**Write Signal:** This active low input functions as the write signal from the local µP. When this pin is pulled "Low" (if $\overline{CS}$ is "Low") the LIU is informed that a write operation has been requested and begins the process of the write cycle.
$\overline{RDY}$_$\overline{TA}$	$\overline{RDY}$	O	**Ready Output:** This active low signal is provided by the LIU device. It indicates that the current read or write cycle is complete, and the LIU is waiting for the next command.

TABLE 17: MOTOROLA MODE: MICROPROCESSOR INTERFACE SIGNALS

XRT83L314 PIN NAME	MOTOROLA EQUIVALENT PIN	TYPE	DESCRIPTION
ALE_TS	TS	I	**Transfer Start:** This active high signal is used to latch the contents on the address bus ADDR[7:0]. The contents of the address bus are latched into the ADDR[7:0] inputs on the falling edge of TS.
$\overline{WR}$_R/$\overline{W}$	R/$\overline{W}$	I	**Read/Write:** This input pin from the local µP is used to inform the LIU whether a Read or Write operation has been requested. When this pin is pulled "High", $\overline{WE}$ will initiate a read operation. When this pin is pulled "Low", $\overline{WE}$ will initiate a write operation.
$\overline{RD}$_$\overline{WE}$	$\overline{WE}$	I	**Write Enable:** This active low input functions as the read or write signal from the local µP dependent on the state of R/$\overline{W}$. When $\overline{WE}$ is pulled "Low" (If $\overline{CS}$ is "Low") the LIU begins the read or write operation.
No Pin	$\overline{OE}$	I	**Output Enable:** This signal is not necessary for the XRT83L314 to interface to the MPC8260 or MPC860 Power PCs.
µPCLK	CLKOUT	I	**Synchronous Processor Clock:** This signal is used as the timing reference for the Power PC synchronous mode.
$\overline{RDY}$_$\overline{TA}$	$\overline{TA}$	O	**Transfer Acknowledge:** This active low signal is provided by the LIU device. It indicates that the current read or write cycle is complete, and the LIU is waiting for the next command.

5.2   INTEL MODE PROGRAMMED I/O ACCESS (ASYNCHRONOUS)

If the LIU is interfaced to an Intel type µP, then it should be configured to operate in the Intel mode. Intel type Read and Write operations are described below.

Intel Mode Read Cycle

Whenever an Intel-type µP wishes to read the contents of a register, it should do the following.

1.   Place the address of the target register on the address bus input pins ADDR[10:0].

2.   While the µP is placing this address value on the address bus, the address decoding circuitry should assert the $\overline{CS}$ pin of the LIU, by toggling it "Low". This action enables further communication between the µP and the LIU microprocessor interface block.

3.   Toggle the ALE input pin "High". This step enables the address bus input drivers, within the microprocessor interface block of the LIU.

4.   The µP should then toggle the ALE pin "Low". This step causes the LIU to latch the contents of the address bus into its internal circuitry. At this point, the address of the register has now been selected.

5.   Next, the µP should indicate that this current bus cycle is a Read operation by toggling the $\overline{RD}$ input pin "Low". This action also enables the bi-directional data bus output drivers of the LIU.

6.   After the µP toggles the Read signal "Low", the LIU will toggle the $\overline{RDY}$ output pin "Low". The LIU does this in order to inform the µP that the data is available to be read by the µP, and that it is ready for the next command.

7.   After the µP detects the $\overline{RDY}$ signal and has read the data, it can terminate the Read Cycle by toggling the $\overline{RD}$ input pin "High".

NOTE: $\overline{ALE}$ *can be tied "High" if this signal is not available.*

The Intel Mode Write Cycle

Whenever an Intel type µP wishes to write a byte or word of data into a register within the LIU, it should do the following.

1.   Place the address of the target register on the address bus input pins ADDR[10:0].

2.   While the µP is placing this address value on the address bus, the address decoding circuitry should assert the $\overline{CS}$ pin of the LIU, by toggling it "Low". This action enables further communication between the µP and the LIU microprocessor interface block.

3.   Toggle the ALE input pin "High". This step enables the address bus input drivers, within the microprocessor interface block of the LIU.

4.   The µP should then toggle the ALE pin "Low". This step causes the LIU to latch the contents of the address bus into its internal circuitry. At this point, the address of the register has now been selected.

5.   The µP should then place the byte or word that it intends to write into the target register, on the bi-directional data bus DATA[7:0].

6.   Next, the µP should indicate that this current bus cycle is a Write operation by toggling the $\overline{WR}$ input pin "Low". This action also enables the bi-directional data bus input drivers of the LIU.

7.   After the µP toggles the Write signal "Low", the LIU will toggle the $\overline{RDY}$ output pin "Low". The LIU does this in order to inform the µP that the data has been written into the internal register location, and that it is ready for the next command.

NOTE: $\overline{ALE}$ *can be tied "High" if this signal is not available.*

The Intel Read and Write timing diagram is shown in Figure 42. The timing specifications are shown in Table 18.

FIGURE 42. INTEL µP INTERFACE SIGNALS DURING PROGRAMMED I/O READ AND WRITE OPERATIONS
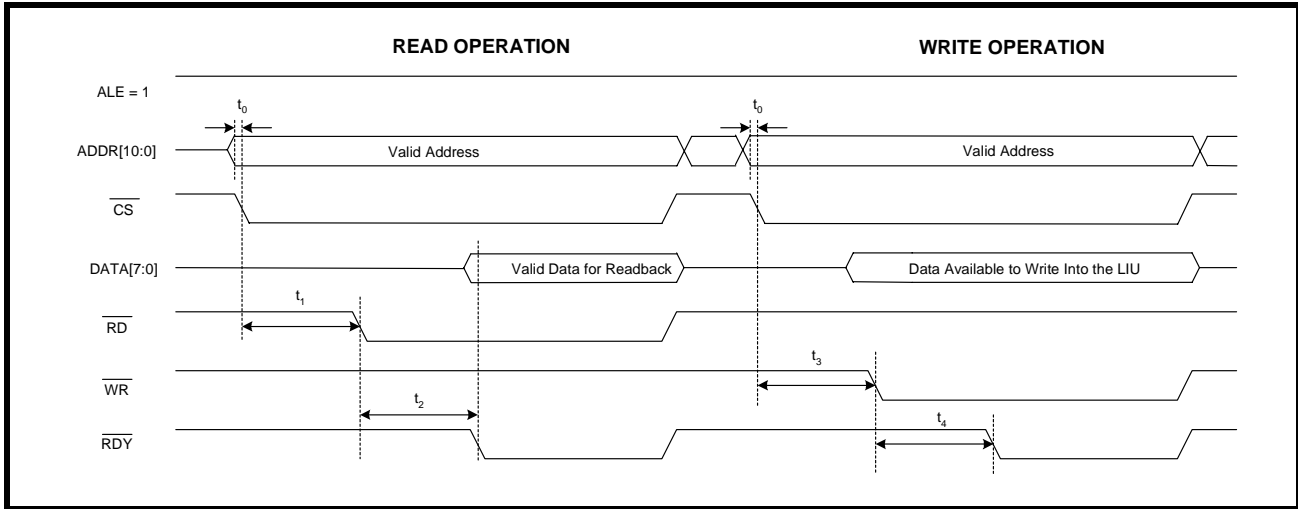

TABLE 18: INTEL MICROPROCESSOR INTERFACE TIMING SPECIFICATIONS

SYMBOL	PARAMETER	MIN	MAX	UNITS

NA	$\overline{WR}$ Pulse Width (t_4)	150	-	ns

5.3 MOTOROLA MODE PROGRAMMED I/O ACCESS (SYNCHRONOUS)

If the LIU is interfaced to a Motorola type µP, it should be configured to operate in the Motorola mode. Motorola type programmed I/O Read and Write operations are described below.

Motorola Mode Read Cycle

Whenever a Motorola type µP wishes to read the contents of a register, it should do the following.

1. Place the address of the target register on the address bus input pins ADDR[10:0].
2. While the µP is placing this address value on the address bus, the address decoding circuitry should assert the $\overline{CS}$ pin of the LIU, by toggling it "Low". This action enables further communication between the µP and the LIU microprocessor interface block.
3. The µP should then toggle the TS pin "Low". This step causes the LIU to latch the contents of the address bus into its internal circuitry. At this point, the address of the register has now been selected.
4. Next, the µP should indicate that this current bus cycle is a Read operation by pulling the R/$\overline{W}$ input pin "High".
5. Toggle the $\overline{WE}$ input pin "Low". This action enables the bi-directional data bus output drivers of the LIU.
6. After the µP toggles the $\overline{WE}$ signal "Low", the LIU will toggle the $\overline{TA}$ output pin "Low". The LIU does this in order to inform the µP that the data is available to be read by the µP, and that it is ready for the next command.
7. After the µP detects the $\overline{TA}$ signal and has read the data, it can terminate the Read Cycle by toggling the $\overline{WE}$ input pin "High".

Motorola Mode Write Cycle

Whenever a motorola type µP wishes to write a byte or word of data into a register within the LIU, it should do the following.

1. Place the address of the target register on the address bus input pins ADDR[10:0].
2. While the µP is placing this address value on the address bus, the address decoding circuitry should assert the $\overline{CS}$ pin of the LIU, by toggling it "Low". This action enables further communication between the µP and the LIU microprocessor interface block.
3. The µP should then toggle the TS pin "Low". This step causes the LIU to latch the contents of the address bus into its internal circuitry. At this point, the address of the register has now been selected.
4. Next, the µP should indicate that this current bus cycle is a Write operation by pulling the R/$\overline{W}$ input pin "Low".
5. Toggle the $\overline{WE}$ input pin "Low". This action enables the bi-directional data bus output drivers of the LIU.
6. After the µP toggles the $\overline{WE}$ signal "Low", the LIU will toggle the $\overline{TA}$ output pin "Low". The LIU does this in order to inform the µP that the data has been written into the internal register location, and that it is ready for the next command.
7. After the µP detects the $\overline{TA}$ signal and has read the data, it can terminate the Read Cycle by toggling the $\overline{WE}$ input pin "High".

The Motorola Read and Write timing diagram is shown in Figure 43. The timing specifications are shown in Table 19.

TABLE 26: MICROPROCESSOR REGISTER 0X01H BIT DESCRIPTION

CHANNEL 0-13 (0X01H-0XD1H)				
BIT	NAME	FUNCTION	Register Type	Default Value (HW reset)
D7	RxTSEL	**Receive Termination Select** Upon power up, the receiver is in "High" impedance. RxTSEL is used to switch between the internal termination and "High" impedance. 0 = "High" Impedance 1 = Internal Termination	R/W	0
D6	TxTSEL	**Transmit Termination Select** Upon power up, the transmitter is in "High" impedance. TxTSEL is used to switch between the internal termination and "High" impedance. 0 = "High" Impedance 1 = Internal Termination	R/W	0

TABLE 26: MICROPROCESSOR REGISTER 0X01H BIT DESCRIPTION

		CHANNEL 0-13 (0X01H-0XD1H)		
BIT	**NAME**	**FUNCTION**	Register Type	Default Value (HW reset)
D5 D4	TERSEL1 TERSEL0	**Receive Line Impedance Select** TERSEL[1:0] are used to select the line impedance for T1/J1/E1. 00 = 100Ω 01 = 110Ω 10 = 75Ω 11 = 120Ω	R/W	0 0
D3	RxJASEL	**Receive Jitter Attenuator Select** RxJASEL is used to enable the receiver jitter attenuator. By default, RxJASEL is disabled. 0 = Disabled 1 = Enabled	R/W	0
D2	TxJASEL	**Transmit Jitter Attenuator Select** TxJASEL is used to enable the transmitter jitter attenuator. By default, TxJASEL is disabled. 0 = Disabled 1 = Enabled	R/W	0
D1	JABW	**Jitter Bandwidth (E1 Mode Only, T1 is permanently set to 3Hz)** The jitter bandwidth is a global setting that is applied to both the receiver and transmitter jitter attenuator. 0 = 10Hz 1 = 1.5Hz	R/W	0
D0	FIFOS	**FIFO Depth Select** The FIFO depth select is used to configure the part for a 32-bit or 64-bit FIFO (within the jitter attenuator blocks). The delay of the FIFO is equal to ½ the FIFO depth. This is a global setting that is applied to both the receiver and transmitter FIFO. 0 = 32-Bit 1 = 64-Bit	R/W	0

TABLE 27: MICROPROCESSOR REGISTER 0X02H BIT DESCRIPTION

		CHANNEL 0-13 (0X02H-0XD2H)		
BIT	**NAME**	**FUNCTION**	Register Type	Default Value (HW reset)
D7	INVQRSS	**QRSS inversion** INVQRSS is used to invert the transmit QRSS pattern set by the TxTEST[2:0] bits. By default, INVQRSS is disabled and the QRSS will be transmitted with normal polarity. 0 = Disabled 1 = Enabled	R/W	0
D6 D5 D4	TxTEST2 TxTEST1 TxTEST0	**Test Code Pattern** TxTEST[2:0] are used to select a diagnostic test pattern to the line (transmit outputs). 0XX = No Pattern 100 = Tx QRSS 101 = Tx TAOS 110 = Tx TLUC 111 = Tx TLDC	R/W	0 0 0
D3	TxOn	**Transmit ON/OFF** Upon power up, the transmitters are powered off. This bit is used to turn the transmitter for this channel On or Off if the TxON pin is pulled "High". If the TxON pin is pulled "Low", all 14 transmitters are powered off. 0 = Transmitter is Powered OFF 1 = Transmitter is Powered ON	R/W	0
D2 D1 D0	LOOP2 LOOP1 LOOP0	**Loopback Diagnostic Select** LOOP[2:0] are used to select the loopback mode. 0XX = No Loopback 100 = Dual Loopback 101 = Analog Loopback 110 = Remote Loopback 111 = Digital Loopback	R/W	0 0 0

TABLE 28: MICROPROCESSOR REGISTER 0X03H BIT DESCRIPTION

CHANNEL 0-13 (0X03H-0XD3H)					
BIT	**NAME**	**FUNCTION**	Register Type	Default Value (HW reset)	
D7 D6	NLCDE1 NLCDE0	**Network Loop Code Detection Enable** NLCDE[1:0] are used to select the loop code detection. 00 = Disabled 01 = Detect Loop Up Code 10 = Detect Loop Down Code 11 = Automatic Loop Code Detection	R/W	0 0	
D5	CODES	**Encoding/Decoding Select (Single Rail Mode Only)** 0 = HDB3 (E1), B8ZS (T1) 1 = AMI Coding	R/W	0	
D4 D3	RxRES1 RxRES0	**Receive External Fixed Resistor** RxRES[1:0] are used to select the value for a high precision external resistor to improve return loss. 00 = None 01 = 240Ω 10 = 210Ω 11 = 150Ω	R/W	0 0	
D2	INSBPV	**Insert Bipolar Violation** When this bit transitions from a "0" to a "1", a bipolar violation will be inserted in the transmitted QRSS/PRBS pattern. The state of this bit will be sampled on the rising edge of TCLK. To ensure proper operation, it is recommended to write a "0" to this bit before writing a "1".	R/W	0	
D1	INSBER	**Insert Bit Error** When this bit transitions from a "0" to a "1", a bit error will be inserted in the transmitted QRSS/PRBS pattern. The state of this bit will be sampled on the rising edge of TCLK. To ensure proper operation, it is recommended to write a "0" to this bit before writing a "1".	R/W	0	
D0	Reserved	This Register Bit is Not Used.			

TABLE 29: MICROPROCESSOR REGISTER 0X04H BIT DESCRIPTION

		CHANNEL 0-13 (0X04H-0XD4H)		
BIT	**NAME**	**FUNCTION**	Register Type	Default Value (HW reset)
D7	EQFLAGE	**Equalizer Attenuation Flag Enable** 0 = Masks the EQFLAG function 1 = Enables Interrupt Generation	R/W	0
D6	DMOIE	**Digital Monitor Output Interrupt Enable** 0 = Masks the DMO function 1 = Enables Interrupt Generation	R/W	0
D5	FLSIE	**FIFO Limit Status Interrupt Enable** 0 = Masks the FLS function 1 = Enables Interrupt Generation	R/W	0
D4	LCV/OFIE	**Line Code Violation / Counter Overflow Interrupt Enable** 0 = Masks the LCV/OF function 1 = Enables Interrupt Generation	R/W	0
D3	NLCDIE	**Network Loop Code Detection Interrupt Enable** 0 = Masks the NLCD function 1 = Enables Interrupt Generation	R/W	0
D2	AISIE	**Alarm Indication Signal Interrupt Enable** 0 = Masks the AIS function 1 = Enables Interrupt Generation	R/W	0
D1	RLOSIE	**Receiver Loss of Signal Interrupt Enable** 0 = Masks the RLOS function 1 = Enables Interrupt Generation	R/W	0
D0	QRPDIE	**Quasi Random Signal Source Interrupt Enable** 0 = Masks the QRPD function 1 = Enables Interrupt Generation	R/W	0

NOTE: *The GIE bit in the global register 0xE0h must be set to "1" in addition to the individual register bits to enable the interrupt pin.*

TABLE 30: MICROPROCESSOR REGISTER 0X05H BIT DESCRIPTION

CHANNEL 0-13 (0X05H-0XD5H)				
BIT	**NAME**	**FUNCTION**	Register Type	Default Value (HW reset)
D7	EQFLAG	**Equalizer Attenuation Flag** The equalizer attenuation flag is always active regardless if the interrupt generation is disabled. This bit indicates the EQFLAG activity. An interrupt will not occur unless the EQFLAGE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = Equalizer Attenuation Flag is Set	RO	0
D6	DMO	**Digital Monitor Output** The digital monitor output is always active regardless if the interrupt generation is disabled. This bit indicates the DMO activity. An interrupt will not occur unless the DMOIE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = Transmit output driver has failures	RO	0
D5	FLS	**FIFO Limit Status** The FIFO limit status is always active regardless if the interrupt generation is disabled. This bit indicates whether the RD/WR pointers are within 3-Bits. An interrupt will not occur unless the FLSIE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = RD/WR FIFO pointers are within ±3-Bits	RO	0
D4	LCV/OF	**Line Code Violation / Counter Overflow** This bit serves a dual purpose. By default, this bit monitors the line code violation activity. However, if bit 7 in register 0xE5h is set to a "1", this bit monitors the overflow status of the internal LCV counter. An interrupt will not occur unless the LCV/OFIE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = A line code violation, bipolar violation, or excessive zeros has occurred	RO	0
D3	NLCD	**Network Loop Code Detection** The network loop code detection is always active regardless if the interrupt generation is disabled. This bit indicates the NLCD activity. An interrupt will not occur unless the NLCDIE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = Network loop code detected according to the mode selected in channel register 0x03h	RO	0

NOTE: *The GIE bit in the global register 0xE0h must be set to "1" in addition to the individual register bits to enable the interrupt pin.*

TABLE 30: MICROPROCESSOR REGISTER 0X05H BIT DESCRIPTION

CHANNEL 0-13 (0X05H-0XD5H)				
BIT	**NAME**	**FUNCTION**	Register Type	Default Value (HW reset)
D2	AISD	**Alarm Indication Signal** The alarm indication signal detection is always active regardless if the interrupt generation is disabled. This bit indicates the AIS activity. An interrupt will not occur unless the AISIE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = An all ones signal is detected	RO	0
D1	RLOS	**Receiver Loss of Signal** The receiver loss of signal detection is always active regardless if the interrupt generation is disabled. This bit indicates the RLOS activity. An interrupt will not occur unless the RLOSIE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = An RLOS condition is present	RO	0
D0	QRPD	**Quasi Random Pattern Detection** The quasi random pattern detection is always active regardless if the interrupt generation is disabled. This bit indicates that a QRPD has been detected. An interrupt will not occur unless the QRPDIE is set to "1" in the channel register 0x04h and GIE is set to "1" in the global register 0xE0h. 0 = No Alarm 1 = A QRP is detected	RO	0

TABLE 31: MICROPROCESSOR REGISTER 0X06H BIT DESCRIPTION

D0	LCVCNT0			0

CLOCK SELECT REGISTER

The input clock source is used to generate all the necessary clock references internally to the LIU. The microprocessor timing is derived from a PLL output which is chosen by programming the Clock Select Bits in register 0xE9h. Therefore, if the clock selection bits are being programmed, the frequency of the PLL output will be adjusted accordingly. During this adjustment, it is important to "Not" write to any other bit location within the same register while selecting the input/output clock frequency. For best results, register 0xE9h can be broken down into two sub-registers with the MSB being bits D[7:4] and the LSB being bits D[3:0] as shown in Figure 45. Note: Bits D[7:6] are reserved.

FIGURE 45. REGISTER 0XE9H SUB REGISTERS
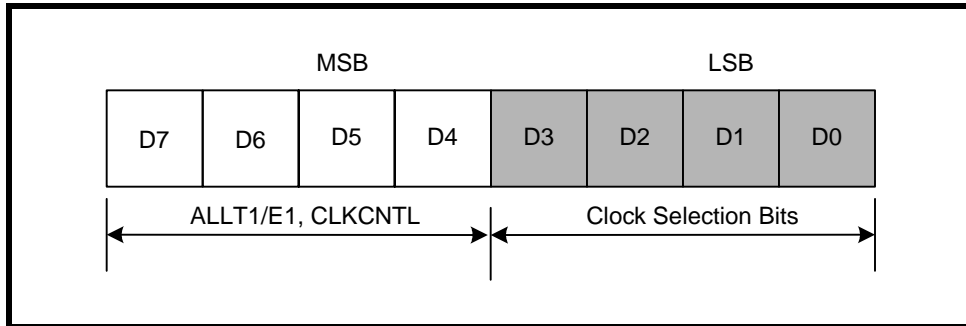

Programming Examples:

Example 1: Changing bits D[7:4]

If bits D[7:4] are the only values within the register that will change in a WRITE process, the microprocessor only needs to initiate ONE write operation.

Example 2: Changing bits D[3:0]

If bits D[3:0] are the only values within the register that will change in a WRITE process, the microprocessor only needs to initiate ONE write operation.

Example 3: Changing bits within the MSB and LSB

In this scenario, one must initiate TWO write operations such that the MSB and LSB do not change within ONE write cycle. It is recommended that the MSB and LSB be treated as two independent sub-registers. One can either change the clock selection (LSB) and then change bits D[5:4] (MSB) on the SECOND write, or vice-versa. No order or sequence is necessary.
