

16-bit latched transceiver with dual enable and master reset (3-State)

74ABT161543

74ABTH161543

FEATURES

- Two 8-bit octal transceivers with D-type latch
- Live insertion/extraction permitted
- Power-up 3-State
- Power-up reset
- Multiple V_{CC} and GND pins minimize switching noise
- Back-to-back registers for storage
- Separate controls for data flow in each direction
- 74ABT161543 incorporates Bus hold data inputs which eliminate the need for external pull-up resistors to hold unused inputs
- Output capability: +64mA/-32mA
- Latch-up protection exceeds 500mA per Jedec Std 17
- ESD protection exceeds 2000V per MIL STD 883 Method 3015 and 200V per Machine Model
- Same function as ABT16543 except for additional Master Reset control pins

DESCRIPTION

The 74ABT161543 high-performance BiCMOS device combines low static and dynamic power dissipation with high speed and high output drive.

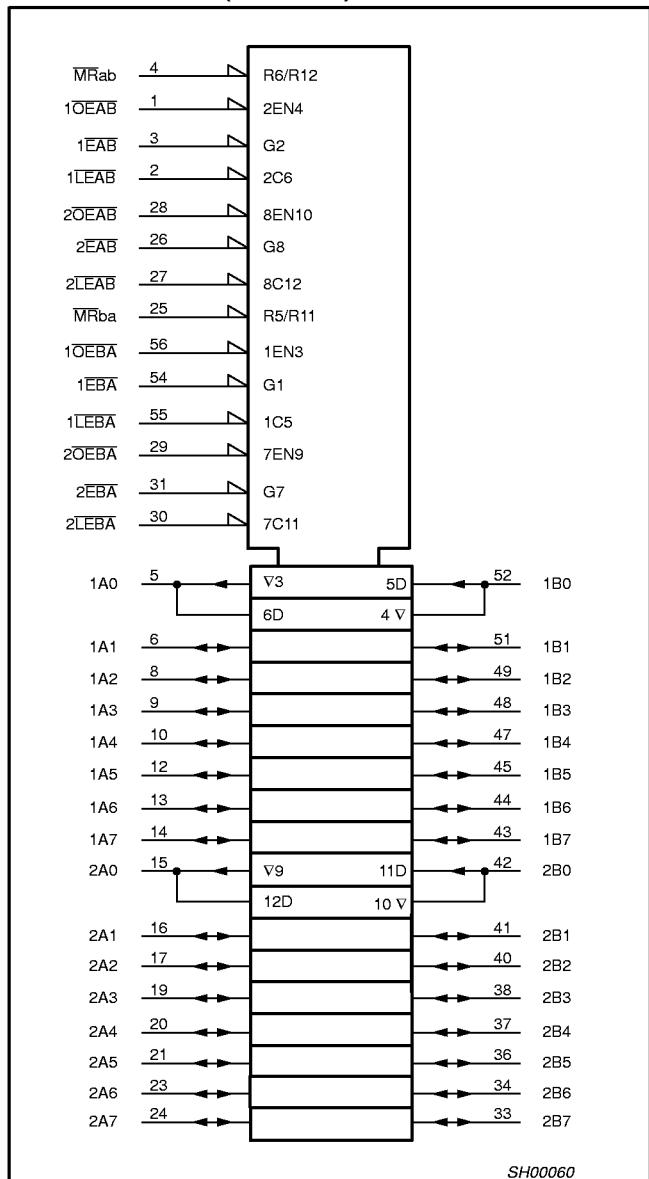

The 74ABT161543 16-bit registered transceiver contains two sets of D-type latches for temporary storage of data flowing in either direction. Separate Latch Enable ($nLEAB$, $nLEBA$) and Output Enable ($nOEAB$, $nOEBA$) inputs are provided for each register to permit independent control of data transfer in either direction. Master reset (MR) clears all registers simultaneously and sets them Low. The outputs are guaranteed to sink 64mA.

Two options are available, 74ABT161543 which does not have the Bus hold feature and 74ABTH161543 which incorporates the Bus hold feature.

FUNCTIONAL DESCRIPTION

The 74ABT161543 contains two sets of eight D-type latches, with separate control pins for each set. Using data flow from A to B as an example, when the A-to-B Enable ($n\bar{E}AB$) input and the A-to-B Latch Enable ($n\bar{L}EAB$) input are Low the A-to-B path is transparent.

A subsequent Low-to-High transition of the $n\bar{L}EAB$ signal puts the A data into the latches where it is stored and the B outputs no longer change with the A inputs. With $\bar{E}AB$ and $n\bar{O}\bar{E}AB$ both Low, the 3-State B output buffers are active and display the data present at the outputs of the A latches.

Control of data flow from B to A is similar, but using the $n\bar{E}BA$, $n\bar{L}EBA$, and $n\bar{O}\bar{E}BA$ inputs.

FUNCTION TABLE

INPUTS					OUTPUTS	STATUS
$n\bar{O}EXX$	$n\bar{M}RXX$	$n\bar{E}XX$	$n\bar{L}EXX$	nAx or nBx	nBx or nAx	
L	L	L	X	X	L	Clear
H	X	X	X	X	Z	Disabled
X	X	H	X	X	Z	Disabled
L	H	↑	L	h	Z	Disabled + Latch
L	H	L	↑	l	L	Latch + Display
L	H	L	L	H	H	Transparent
L	H	L	H	X	NC	Hold

H = High voltage level

h = High voltage level one set-up time prior to the Low-to-High transition of $n\bar{L}EXX$ or $n\bar{E}XX$ (XX = AB or BA)

L = Low voltage level

I = Low voltage level one set-up time prior to the Low-to-High transition of $n\bar{L}EXX$ or $n\bar{E}XX$ (XX = AB or BA)

X = Don't care

↑ = Low-to-High transition of $n\bar{L}EXX$ or $n\bar{E}XX$ (XX = AB or BA)

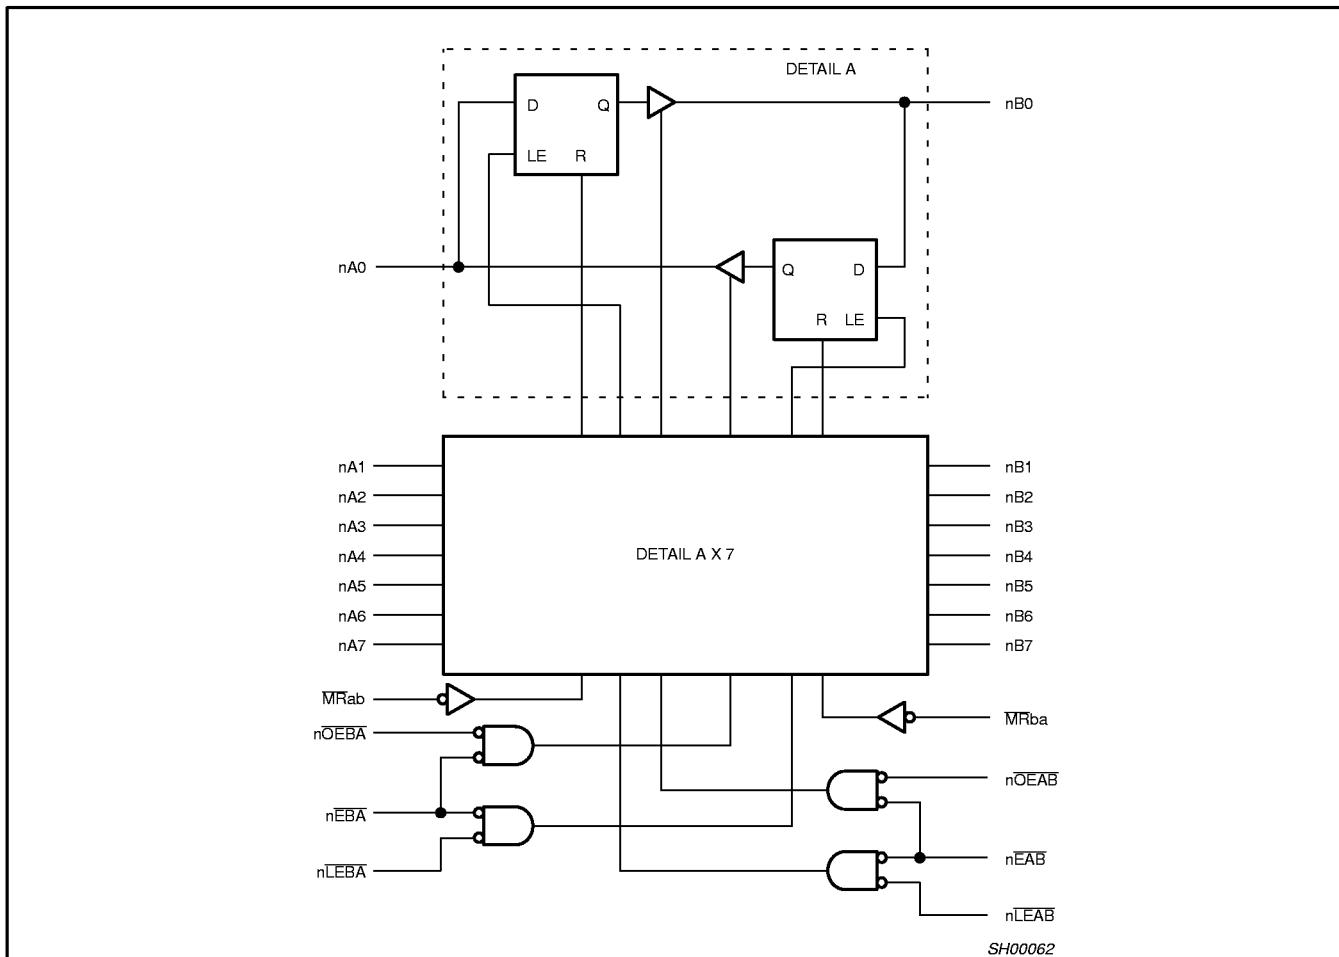

NC = No change

Z = High impedance or "off" state

LOGIC DIAGRAM

ABSOLUTE MAXIMUM RATINGS^{1, 2}

SYMBOL	PARAMETER	CONDITIONS	RATING	UNIT
V_{CC}	DC supply voltage		-0.5 to +7.0	V
I_{IK}	DC input diode current	$V_I < 0$	-18	mA
V_I	DC input voltage ³		-1.2 to +7.0	V
I_{OK}	DC output diode current	$V_O < 0$	-50	mA
V_{OUT}	DC output voltage ³	output in Off or High state	-0.5 to +5.5	V
I_{OUT}	DC output current	output in Low state	128	mA
		output in High state	-64	mA
T_{stg}	Storage temperature range		-65 to 150	°C

NOTES:

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability. The maximum junction temperature of this integrated circuit should not exceed 150°C.
3. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

ΔI_{CC}	Additional supply current per input pin ² 74ABTH161543	$V_{CC} = 5.5\text{V}; \text{one input at } 3.4\text{V, other inputs at } V_{CC} \text{ or GND}$		0.20	1

NOTES:

- Not more than one output should be tested at a time, and the duration of the test should not exceed one second.
- This is the increase in supply current for each input at 3.4V.
- For valid test results, data must not be loaded into the flip-flops (or latches) after applying the power.
- This parameter is valid for any V_{CC} between 0V and 2.1V, with a transition time of up to 10msec. From $V_{CC} = 2.1\text{V}$ to $V_{CC} = 5\text{V} \pm 10\%$ a transition time of up to 100μsec is permitted.
- This is the bus hold overdrive current required to force the input to the opposite logic state.
