

**6A, 30V, 0.032 Ohm, Dual N-Channel,
Logic Level UltraFET Power MOSFET**

This N-Channel power MOSFET is manufactured using the innovative UltraFET process. This advanced process technology achieves the

lowest possible on-resistance per silicon area, resulting in outstanding performance. This device is capable of withstanding high energy in the avalanche mode and the diode exhibits very low reverse recovery time and stored charge. It was designed for use in applications where power efficiency is important, such as switching regulators, switching converters, motor drivers, relay drivers, low-voltage bus switches, and power management in portable and battery-operated products.

Formerly developmental type TA76113.

Ordering Information

PART NUMBER	PACKAGE	BRAND
HUF76113DK8	MS-012AA	76113DK8

NOTE: When ordering, use the entire part number. Add the suffix T to obtain the variant in tape and reel, e.g., HUF76113DK8T.

Features

- Logic Level Gate Drive
- 6A, 30V
- Ultra Low On-Resistance, $r_{DS(ON)} = 0.032\Omega$
- Temperature Compensating PSpice® Model
- Temperature Compensating SABER™ Model
- Thermal Impedance SPICE Model
- Thermal Impedance SABER Model
- Peak Current vs Pulse Width Curve
- UIS Rating Curve
- Related Literature

Thermal Resistance vs. Mounting Pad Area

The maximum rated junction temperature, T_{JM} , and the thermal resistance of the heat dissipating path determines the maximum allowable device power dissipation, P_{DM} , in an application. Therefore the application's ambient temperature, T_A ($^{\circ}\text{C}$), and thermal resistance $R_{\theta JA}$ ($^{\circ}\text{C}/\text{W}$) must be reviewed to ensure that T_{JM} is never exceeded. Equation 1 mathematically represents the relationship and serves as the basis for establishing the rating of the part.

$$P_{DM} = \frac{(T_{JM} - T_A)}{Z_{\theta JA}} \quad (\text{EQ. 1})$$

In using surface mount devices such as the SOP-8 package, the environment in which it is applied will have a significant influence on the part's current and maximum power dissipation ratings. Precise determination of P_{DM} is complex and influenced by many factors:

1. Mounting pad area onto which the device is attached and whether there is copper on one side or both sides of the board.
2. The number of copper layers and the thickness of the board.

3. The use of external heat sinks.
4. The use of thermal vias.
5. Air flow and board orientation.
6. For non steady state applications, the pulse width, the duty cycle and the transient thermal response of the part, the board and the environment they are in.

Fairchild provides thermal information to assist the designer's preliminary application evaluation. Figure 23 defines the $R_{\theta JA}$ for the device as a function of the top copper (component side) area. This is for a horizontally positioned FR-4 board with 1oz copper after 1000 seconds of steady state power with no air flow. This graph provides the necessary information for calculation of the steady state junction temperature or power dissipation. Pulse applications can be evaluated using the Fairchild device Spice thermal model or manually utilizing the normalized maximum transient thermal impedance curve.

Displayed on the curve are $R_{\theta JA}$ values listed in the Electrical Specifications table. The points were chosen to depict the compromise between the copper board area, the thermal resistance and ultimately the power dissipation, P_{DM} .

Thermal resistances corresponding to other copper areas can be obtained from Figure 23 or by calculation using Equation 2. $R_{\theta JA}$ is defined as the natural log of the area times a coefficient added to a constant. The area, in square inches is the top copper area including the gate and source pads.

$$R_{\theta JA} = 103.2 - 24.3 \times \ln(\text{Area}) \quad (\text{EQ. 2})$$

FIGURE 23. THERMAL RESISTANCE vs MOUNTING PAD AREA

While Equation 2 describes the thermal resistance of a single die, several of the new UltraFETs are offered with two die in the SOP-8 package. The dual die SOP-8 package introduces an additional thermal component, thermal coupling resistance, $R_{\theta\beta}$. Equation 3 describes $R_{\theta\beta}$ as a function of the top copper mounting pad area.

$$R_{\theta\beta} = 46.4 - 21.7 \times \ln(\text{Area}) \quad (\text{EQ. 3})$$

The thermal coupling resistance vs. copper area is also graphically depicted in Figure 23. It is important to note the thermal resistance ($R_{\theta JA}$) and thermal coupling resistance ($R_{\theta\beta}$) are equivalent for both die. For example at 0.1 square inches of copper:

$$R_{\theta JA1} = R_{\theta JA2} = 159^\circ\text{C/W}$$

$$R_{\theta\beta1} = R_{\theta\beta2} = 97^\circ\text{C/W}$$

T_{J1} and T_{J2} define the junction temperature of the respective die. Similarly, P_1 and P_2 define the power dissipated in each die. The steady state junction temperature can be calculated using Equation 4 for die 1 and Equation 5 for die 2.

Example: To calculate the junction temperature of each die when die 2 is dissipating 0.5 Watts and die 1 is dissipating 0 Watts. The ambient temperature is 70°C and the package is mounted to a top copper area of 0.1 square inches per die. Use Equation 4 to calculate T_{J1} and Equation 5 to calculate T_{J2} .

$$T_{J1} = P_1 R_{\theta JA} + P_2 R_{\theta\beta} + T_A \quad (\text{EQ. 4})$$

$$T_{J1} = (0 \text{ Watts})(159^\circ\text{C/W}) + (0.5 \text{ Watts})(97^\circ\text{C/W}) + 70^\circ\text{C}$$

$$T_{J1} = 119^\circ\text{C}$$

$$T_{J2} = P_2 R_{\theta JA} + P_1 R_{\theta\beta} + T_A \quad (\text{EQ. 5})$$

$$T_{J2} = (0.5 \text{ Watts})(159^\circ\text{C/W}) + (0 \text{ Watts})(97^\circ\text{C/W}) + 70^\circ\text{C}$$

$$T_{J2} = 150^\circ\text{C}$$

The transient thermal impedance ($Z_{\theta JA}$) is also effected by varied top copper board area. Figure 24 shows the effect of copper pad area on single pulse transient thermal impedance. Each trace represents a copper pad area in square inches corresponding to the descending list in the graph. Spice and SABER thermal models are provided for each of the listed pad areas.

Copper pad area has no perceivable effect on transient thermal impedance for pulse widths less than 100ms. For pulse widths less than 100ms the transient thermal impedance is determined by the die and package. Therefore, CTHERM1 through CTHERM5 and RTHERM1 through RTHERM5 remain constant for each of the thermal models. A listing of the model component values is available in Table 1.
