

10-Bit 105MSPS Sampling Analog-to-Digital Converter

nAD10105-13

FEATURES

- 1.2V power supply
- SNR typ 59dB for ($f_{in} = 10\text{MHz}$)
- Low power (55mW @ 1.2V and 105MSPS)
- Frequency dependent biasing
- Internal Sample/Hold
- Differential input
- Low input capacitance
- Power Down and Sleep Mode

APPLICATIONS

- Imaging
- Test equipment
- Computer scanners
- Wireless communication
- Powerline communication
- Set top boxes
- Video products

GENERAL DESCRIPTION

The nAD10105-13 is a compact, high-speed, low power 10-bit monolithic analog-to-digital converter, implemented in a $0.13\mu\text{m}$ single poly CMOS process with no analog options. The converter includes a high bandwidth sample and hold. Using internal references, the full scale range is $\pm 0.50\text{V}$. The full scale range can be set between $\pm 0.25\text{V}$ and $\pm 0.50\text{V}$ using external references. It operates from a single 1.2V supply. Its low distortion and high dynamic range offers the performance needed for demanding imaging, multimedia, telecommunications and instrumentation applications. The bias current level for the ADC is automatically adjusted based on the clock input frequency. Hence, the power dissipation of the device is continuously minimised for the current operation frequency.

QUICK REFERENCE DATA

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
V_{DD}	Supply voltage		1.0	1.2	1.4	V
I_{DD}	Supply current (105 MSPS)			46		mA
P_D	Power dissipation (10 MSPS)	Except digital output drivers		8		mW
P_D	Power dissipation (1050 MSPS)	Except digital output drivers		55		mW
DNL	Differential nonlinearity	$f_{IN}=0.9991\text{MHz}$			± 0.5	LSB
INL	Integral nonlinearity	$f_{IN}=0.9991\text{MHz}$			± 0.75	LSB
f_S	Conversion rate			105		MHz
N	Resolution				10	bit

Table 1. Quick reference data

GENERAL DESCRIPTION (Continued)

The nAD10105-13 has a pipelined architecture - resulting in low input capacitance. Digital error correction of the 9 most significant bits ensures good linearity for input frequencies approaching Nyquist. The nAD10105-13 is compact. The core occupies less than 0.9mm^2 of die area in a standard single poly $0.13\mu\text{m}$ CMOS process. The fully differential architecture makes it insensitive to substrate noise. Thus it is ideal as a mixed signal ASIC macro cell.

OBJECTIVE PRODUCT SPECIFICATION

nAD10105-13 10 Bit 105 MSPS Sampling ADC IP

ELECTRICAL SPECIFICATIONS

(At $T_A = 25^\circ\text{C}$, $V_{DD} = 1.2\text{V}$, Sampling Rate = 105MHz, Input frequency = 10MHz, Differential input signal, 50% duty cycle clock unless otherwise noted)

Symbol	Parameter (condition)	Test Level	Min.	Typ.	Max.	Units
DC Accuracy						
DNL	Differential Nonlinearity					
	$f_{IN} = 0.9991\text{ MHz}$	IV		± 0.5		LSB
INL	Integral Nonlinearity					
	$f_{IN} = 0.9991\text{ MHz}$	IV		± 0.75		LSB
V_{OS}	Midscale offset			± 1		%FS
CMRR	Common Mode Rejection Ratio			-59		dB
ϵ_G	Gain Error			± 1		%FS
Dynamic Performance						
SNR	Signal to Noise Ratio (without harmonics)					
	$f_{IN} = 10\text{ MHz}$	IV	56	59		dBFS
	$f_{IN} = 40\text{ MHz}$	IV	55	58.5		dBFS
SINAD	Signal to Noise and Distortion Ratio					
	$f_{IN} = 10\text{ MHz}$	IV		58		dBFS
SFDR	Spurious Free Dynamic Range					
	$f_{IN} = 10\text{ MHz}$	IV		70		dB
	$f_{IN} = 40\text{ MHz}$	IV		57		dB
Analog Input						
V_{FSR}	Input Voltage Range (differential)	IV		± 0.50		V
V_{CMI}	Common mode input voltage	IV		TBD		V
C_{INA}	Input Capacitance (from each input to ground)			1.5		pF
Reference Voltages						
V_{REFNI}	Internal reference voltage on pin 10	IV		TBD		V
V_{REFPI}	Internal reference voltage on pin 11	IV		TBD		V
	Internal reference voltage drift				100	ppm/ $^\circ\text{C}$
V_{REFNO}	Negative Input Voltage	IV		TBD		V
V_{REFPO}	Positive Input Voltage	IV		TBD		V
$V_{REFP} - V_{REFN}$	Reference input voltage range ¹⁾	IV		TBD		V
V_{CM}	Common mode output voltage	IV		TBD		V
Switching Performance						
F_S	Conversion Rate	IV		105		MSPS
	Pipeline Delay	IV		6		Clocks
t_{AP}	Aperture delay, IP	V		0.9		ns
t_h	Output hold time, IP	V		0.5		ns
t_d	Output delay time, IP	V		2.5		ns
t_{AP}	Aperture delay, with bonding pad	V		1.0		ns
t_h	Output hold time, with bonding pad	V		1.0		ns
t_d	Output delay time, with bonding pad	V		4.0		ns
Digital Inputs						
V_{IL}	Logic "0" voltage	IV			0.4	V
V_{IH}	Logic "1" voltage	IV	$AV_{DD} - 0.4$			V
I_{IL}	Logic "0" current ($V_I = V_{SS}$)	IV			± 10	μA
I_{IH}	Logic "1" current ($V_I = V_{DD}$)	IV			± 10	μA
C_{IND}	Input Capacitance	IV		5		pF

(table continued on next page)

Digital Outputs						
V _{OL}	Logic "0" voltage (I = 2 mA)	IV		0.2	0.4	V
V _{OH}	Logic "1" voltage (I = 2 mA)	IV	85% OV _{DD}	90% OV _{DD}		V
Power Supply						
V _{DD}	Supply voltage	V	1.0	1.2	1.4	V
I _{DD}	Supply current (except digital output)	IV		46		mA
V _{SS}	Supply voltage			GND		
P _D	Power dissipation (except digital output) (10 MSPS)	IV		8		mW
P _D	Power dissipation (except digital output) (80 MSPS)	IV		55		mW
P _D	Power dissipation (except digital output) Power Down Mode ²⁾	IV		TBD		μW
P _D	Power dissipation (except digital output) Sleep Mode	IV		TBD		μW
AV _{DD} -DV _{DD1}	Analog power – digital power pins		-0.2		+0.2	V
OV _{DD}	Output driver supply voltage		1.6	1.8	2.0	V
T	Ambient operating temperature		-40		+85	°C

Table 2. Electrical specifications

¹⁾ See Figure 5.

²⁾ Power Down Mode is only available for IP version of nAD10105-13.

Test Levels

Test Level I: 100% production tested at +25°C

Test Level II: 100% production tested at +25°C and sample tested at specified temperatures

Test Level III: Sample tested only

Test Level IV: Parameter is guaranteed by design and characterization testing

Test Level V: Parameter is typical value only

Test Level VI: 100% production tested at +25°C. Guaranteed by design and characterization testing for industrial temperature range

ABSOLUTE MAXIMUM RATINGS

Supply voltages

AV_{DD} - 0.2V to +2.2V

DV_{DD1} - 0.2V to V_{DD} + 0.2V

OV_{DD} - 0.2V to V_{DD} + 0.2V

Temperatures

Operating Temperature -40 to +85°C

Storage Temperature... - 65 to +125°C

Input voltages

Analog In - 0.2V to AV_{DD} + 0.2V

Digital In - 0.2V to V_{DD} + 0.2V

REF_P - 0.2V to AV_{DD} + 0.2V

REF_N - 0.2V to AV_{DD} + 0.2V

CLOCK - 0.2V to V_{DD} + 0.2V

Note: Stress above one or more of the limiting values may cause permanent damage to the device.

PIN FUNCTIONS

Pin Name	Description
INP INN	Differential input signal pins. Common mode voltage: 0.9V
REFP REFN	Reference input pins. Bypass with 100nF capacitors close to the pins. See Application Information below.
BIAS0, BIAS1	Digital inputs for max. sampling rate programming. BIAS1=0, BIAS0=0: Sleep mode (power save) BIAS1=0, BIAS0=1: - 12.5% bias BIAS1=1, BIAS0=0: +12.5% bias BIAS1=1, BIAS0=1: Typ. Bias The bias setting is automatically performed based on the clock input frequency. This function should be used ONLY if another bias setting than typical must be used.
CLOCK	Clock input
VCM	Common mode voltage output
BIT9 - BIT0	Digital outputs (MSB to LSB)
OR	OverRange. High if all outputs are zeros or ones. Available on IP.
OUTEN	Enable digital outputs (Keep low for active outputs)
EXTREF	Disable internal references (Keep low for internal references)
PD	Power Down (Keep low for normal operation) Available on IP or with bonding option.
V _{DD}	Power pins for on chip power
V _{SS}	Ground pins
OV _{DD}	Power pins for output drivers

DEFINITIONS

Data sheet status	
Objective product specification	This datasheet contains target specifications for product development.
Preliminary product specification	This datasheet contains preliminary data; supplementary data may be published from Nordic VLSI ASA later.
Product specification	This datasheet contains final product specifications.
Limiting values	
Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Specifications sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

Table 4. Definitions

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Nordic VLSI ASA customers using or selling these products for use in such applications do so at their own risk and agree fully indemnify Nordic VLSI ASA for any damages resulting from such improper use or sale.

APPLICATION INFORMATION

References

The nAD10105-13 has a differential analog input. The input range is determined by the voltages V_{REFP} and V_{REFN} applied to reference pins REFP and REFN respectively, and is equal to $\pm(V_{REFP}-V_{REFN})$. Externally generated reference voltages connected to REFP and REFN should be symmetrical around the common mode input voltage. The input range can be defined between $\pm 0.25V$ and $\pm 0.50V$. The references should be bypassed as close to the converter pins as possible using 100nF capacitors in parallel with smaller capacitors (e.g. 1nF) (to ground).

Analog input

The input of the nAD10105-13 can be configured in various ways - dependent upon whether a single ended or differential, AC- or DC-coupled input is wanted.

AC-coupled input is most conveniently implemented using a transformer with a center tapped secondary winding. The center tap is connected to the CM-node, as shown in figure 6. In order to obtain low distortion, it is important that the selected transformer does not exhibit core saturation at full-scale. Excellent results are obtained with the Mini Circuits T1-6T or T1-1T. Proper termination of the input is important for input signal purity. A small capacitor across the inputs attenuates kickback-noise from the sample and hold. Series resistors as shown in Figure 6 may be advantageous to improve linearity. The VCM-node should be bypassed to ground as closed to the converter pin as possible using 100nF capacitors in parallel with a small one.

Figure 6. Example of AC coupled input using transformer configuration

If a DC-coupled single ended input is wanted, a solution based on operational amplifiers - as shown in Figure 7, is usually preferred. The AD826 is suggested for low distortion and video bandwidth. Lower cost operational amplifiers may be used if the demands are less strict. A good alternative for high performance applications is to use AD8138 single ended to differential amplifier.

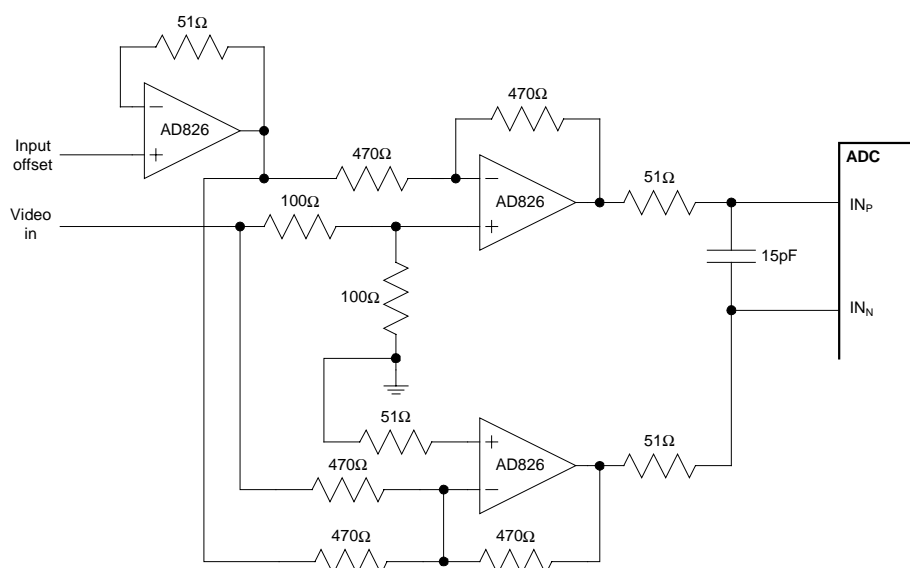

Figure 7. DC-coupled single ended to differential conversion (power supplies and bypassing not shown)

Clock

In order to preserve accuracy at high input frequency, it is important that the clock has low jitter and steep edges. Rise/fall times should be kept shorter than 2ns whenever possible. Overshoot should be avoided. Low jitter is especially important when converting high frequency input signals. Jitter causes the noise floor to rise proportionally to input signal frequency. Jitter may be caused by crosstalk on the PCB. It is therefore recommended that the clock trace on the PCB is made as short as possible.

Digital outputs

The digital output data appears in offset binary code at CMOS logic levels. Full-scale negative input results in output code 000...0. Full-scale positive input results in output code 111...1. Output data are available 6 clock cycles after the data are sampled. The analog input is sampled one aperture delay (t_{AP}) after the high to low clock transition. Output data should be sampled as shown in the timing diagram.

PCB layout and decoupling

A well designed PCB is necessary to get good spectral purity from any high performance ADC. A multilayer PCB with a solid ground plane is recommended for optimum performance. If the system has a split analog and digital ground plane, it is recommended that all ground pins on the ADC are connected to the analog ground plane. It is our experience that this gives the best performance. The power supply pins should be bypassed using 100nF surface mounted capacitors as close to the package pins as possible. Analog and digital supply pins should be separately filtered.

Dynamic testing

Careful testing using high quality instrumentation is necessary to achieve accurate test results on high speed A/D-converters. It is important that the clock source and signal source has low jitter. A spectrally pure, low noise RF signal generator - such as the HP8662A or HP8644B is recommended for the test signal. Low pass filtering or band pass filtering of the input signal is usually necessary to obtain the required spectral purity (SFDR > 75dB). The clock signal can be obtained from either a crystal oscillator or a low-jitter pulse generator. Alternatively, a low-jitter RF-generator can be used as a clock source. At Nordic VLSI, the Marconi Instruments 2041A is used. The sinewave clock must then be applied to an ultra high-speed comparator (e.g. AD9696) and a TTL to CMOS level shifter (e.g. 74LV04) before application to the converter. The most consistent results are obtained if the clock signal is phase locked to the input signal. Phase locking allows testing without windowing of output data. A logic analyzer with deep memory - such as the HP16500-series, is recommended for test data acquisition.

Power Down Mode and Sleep Mode

The nAD10105-13 has both Power Down Mode and Sleep Mode. The Power Down Mode can be used when the ADC should be put to 'zero current consumption' state and when a somewhat longer startup time is allowed. The Sleep Mode can be used to put the ADC in an 'idle' state and when the application require a quick startup. The two different power consumption saving schemes can be activated through the PD, BIAS0 and BIAS1 pins/connections in the following manner:

Power Down Mode: PD=1, BIAS0=0, BIAS1=0

Sleep Mode: PD=0, BIAS0=0, BIAS1=0

The actual startup time from these modes are dependent on the external decoupling configuration.
