NOTE 1: Z_S is measured by superimposing a 90 Hz rms signal to 10% of V_S on V_S .

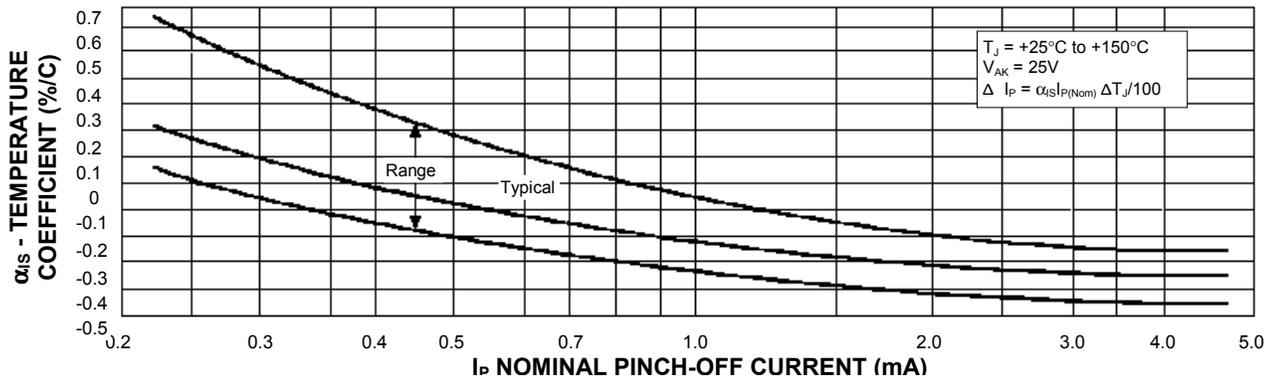

NOTE 2: Z_K is derived by superimposing a 90 Hz rms signal to 10% of V_K on V_K .

SYMBOLS AND DEFINITIONS

- I_D Diode Current
- V_L Limiting Voltage: Measured at I_L , V_L , together with Knee ac Impedance, Z_K , indicates the Knee characteristic of the device
- α_{IS} Current Temperature Coefficient.
- V_{AK} anode to cathode Voltage
- I_P Pinch-off Current: Regulator current at specified Test Voltage, V_S . I_P is some times identified as I_S
- POV Peak Operating Voltage: Maximum voltage to be applied to the device.
- V_K Knee Impedance test voltage: Specified voltage used to establish Knee Impedance
- V_S TEST VOLTAGE: Voltage at which I_P and Z_S are specified
- Z_K Knee ac impedance at Test Voltage: To test Z_K a 90Hz signal V_K with rms value equal to 10% of test voltage V_K is superimposed on V_K : $Z_K = V_K / i_K$ where i_K is the resultant ac current due to v_K . To provide the most constant current from the diode, Z_K should be as high as possible, therefore, a minimum value of Z_K is specified.
- Z_S AC Impedance at Test Voltage: Specified as a minimum value. To test for Z_S , a 90 Hz signal V_S with rms value equal to 10% of test voltage, V_S is superimposed on V_S : $Z_S = v_S / i_S$ where i_S is the current due to v_S .
