Photo Modules for PCM Remote Control Systems

Available Types For Different Carrier Frequencies

Туре	Fo	Туре	Fo
LTOP-4130	30 kHz	LTOP-4133	33 kHz
LTOP-4136	36 kHz	LTOP-4137	36.7 kHz
LTOP-4138	38 kHz	LTOP-4140	40 kHz
LTOP-4156	56 kHz		

Description

The LTOP-41.. – series are miniaturized receivers for infrared remote control systems. PIN diode and preamplifier are assembled on lead frame, the epoxy package is designed as IR filter.

The demodulated output signal can directly be decoded by a microprocessor. The main benefit is the reliable function even in disturbed ambient and the protection against uncontrolled output pulses.

Features

- Photo detector and preamplifier in one package
- Internal filter for PCM frequency
- TTL and CMOS compatibility
- Output active low
- Improved shielding against electrical field disturbance

- - Small size package
 - High immunity against ambient light
 - Enhanced data rate of 2400 bit/s
 - Suitable burst length \geq 6 cycle/burst

Applications

- TV sets
- Video recorders
- Sat receivers
- DVD
- Slide projectors

- Audio components
- Air conditioner
- Data communication
- Game equipment
- Sensors and light barrier systems for long distances

Application Circuit

Suitable Data Format

The circuit of the LTOP-41.. is designed in that way that unexpected output pulses due to noise or disturbance signals are avoided. A bandpass filter, an integrator stage and an automatic gain control are used to suppress such disturbances.

The distinguishing marks between data signal and disturbance signal are carrier frequency, burst length and duty cycle.

The data signal should fulfill the following condition:

• Carrier frequency should be close to center frequency of the bandpass (e.g. 38kHz)

• Burst length should be 6 cycles/burst or longer

• After each burst which is between 6 cycles and 70 cycles a gap time of at least 10 cycles is necessary

• For each burst which is longer than 1.8ms a corresponding gap time is necessary at some time in the data stream. This gap time should be at least same length as the burst.

• Up to 2200 short bursts per second can be received continuously.

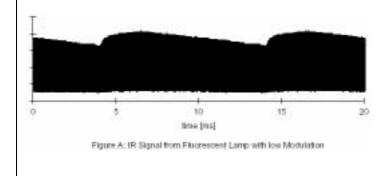

Some examples for suitable data format are: NEC Code, Toshiba Micom Format, Sharp Code, RC5 Code, RC6 Code, RCMM code R-2000 Code, RECS-80 code.

When a disturbance signal is applied to the LTOP-41.. it can still receive the data signal. However the sensitivity is reduced to that level that no unexpected pulses will occur.

Some examples for such disturbance signals which are suppressed by the LTOP-41.. are:

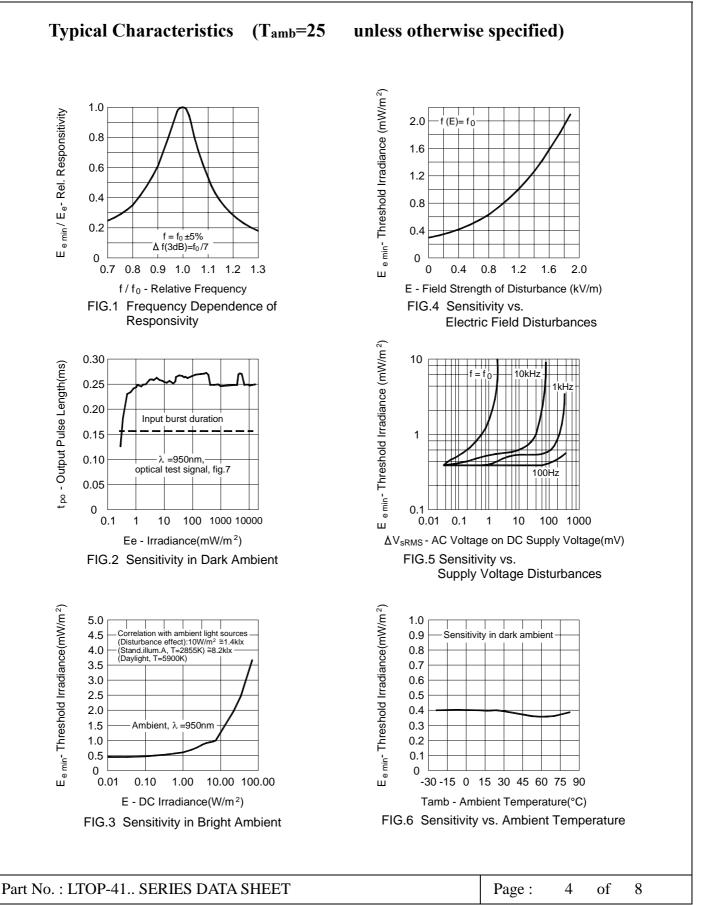

- DC light (e.g. from tungsten bulb or sunlight)
- Continuous signal at 38kHz or at any other frequency

• Signals from fluorescent lamps with electronic ballast (an example of the signal modulation is shown in figure below).
