Multistandard Sound Processor Family

1. Introduction

The MSP 44x0G family of single-chip Multistandard Sound Processors covers the sound processing of all analog TV-Standards worldwide, as well as the NICAM digital sound standards. The full TV sound processing, starting with analog sound IF signal-in, down to processed analog AF-out, is performed on a single chip. Fig. 1–1 shows a simplified functional block diagram of the MSP 44x0G.

This new generation of TV sound processing ICs now includes versions for processing the multichannel television sound (MTS) signal conforming to the standard recommended by the Broadcast Television Systems Committee (BTSC). The DBX noise reduction, or alternatively, Micronas Noise Reduction (MNR) is performed alignment free.

Other processed standards are the Japanese FM-FM multiplex standard (EIA-J) and the FM Stereo Radio standard.

Current ICs have to perform adjustment procedures in order to achieve good stereo separation for BTSC and EIA-J. The MSP 44x0G has optimum stereo performance without any adjustments.

The MSP 44x0G has built-in automatic functions: The IC is able to detect the actual sound standard automatically (Automatic Standard Detection). Furthermore, pilot levels and identification signals can be evaluated internally with subsequent switching between mono/stereo/bilingual; no I^2C interaction is necessary (Automatic Sound Selection).

The MSP 44x0G can handle very high FM deviations even in conjunction with NICAM processing. This is especially important for the introduction of NICAM in China.

All MSP 44xxG versions are pin and software compatible to the MSP 34xxG. The MSP 44x0G has all functions of the MSP 34x0G with additional multichannel digital inputs and outputs. Its sample rate of 48 kHz makes this device ideal for applications in digital TV systems. In general, outline dimensions, electrical characteristics and application diagrams are identical to the MSP 34x0G.

The ICs are manufactured in submicron CMOS technology. The MSP 44x0G is available in the following packages: PQFP80, PLQFP64, and PSDIP64.

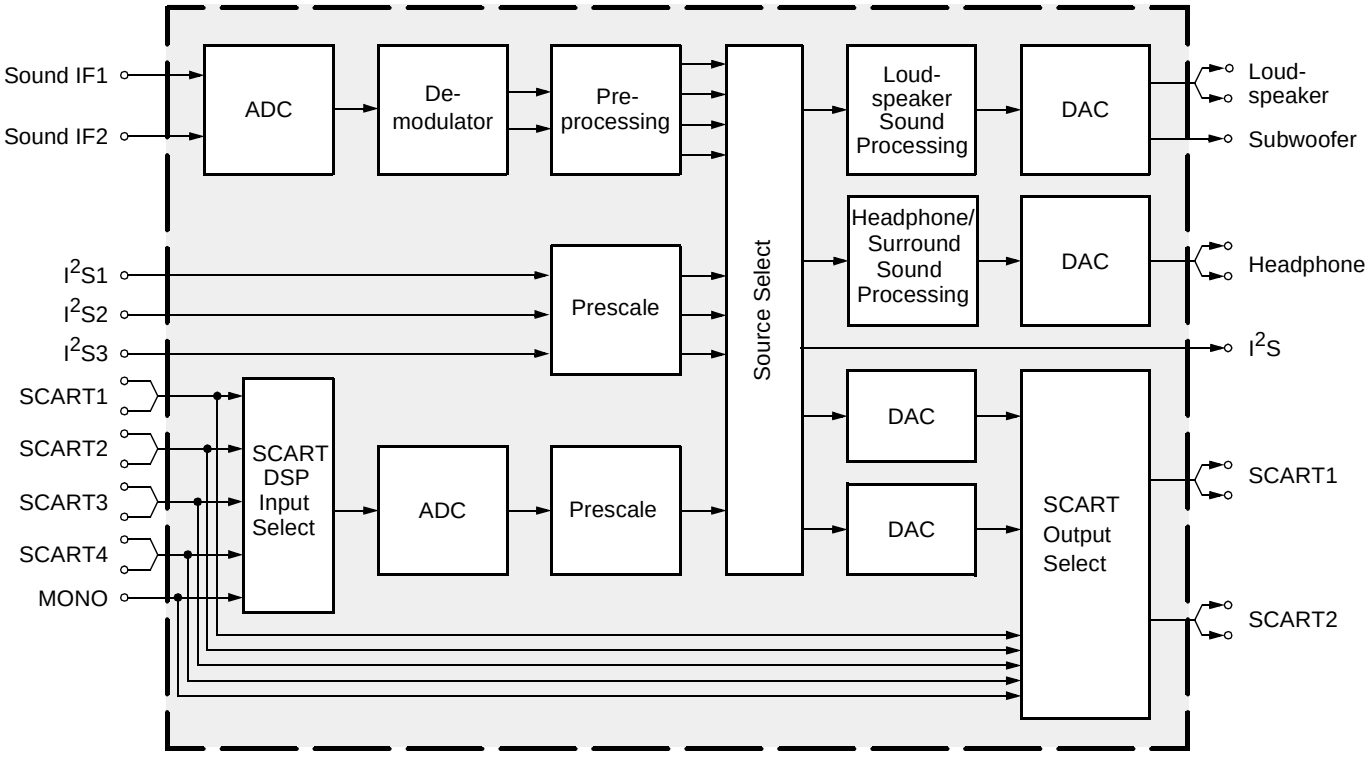

Fig. 1–1: Block diagram of the MSP 44x0G

1.1. Features of the MSP 44x0G Family and Differences to MSPD

Feature (New features not available for MSPD are shaded gray.)	**4410**	**4420**	**4440**	**4450**
48 kHz sampling rate	X	X	X	X
20 kHz audio band width	X	X	X	X
Standard Selection with single I^2C transmission	X	X	X	X
Automatic Standard Detection of terrestrial TV standards/Automatic Carrier Mute function	X	X	X	X
Automatic Sound Selection (mono/stereo/bilingual), new registers MODUS, STATUS	X	X	X	X
Two selectable sound IF (SIF) inputs	X	X	X	X
Automatic Carrier Mute function	X	X	X	X
Interrupt output programmable (indicating status change)	X	X	X	X
Loudspeaker / Headphone channel with volume, balance, bass, treble, loudness	X	X	X	X
Loudspeaker channel with MDB (Micronas Dynamic Bass)	X	X	X	X
AVC: Automatic Volume Correction	X	X	X	X
Subwoofer output with programmable low-pass and complementary high-pass filter	X	X	X	X
5-band graphic equalizer for loudspeaker channel	X	X	X	X
Spatial effect for loudspeaker channel	X	X	X	X
Four Stereo SCART (line) inputs, one Mono input; two Stereo SCART outputs	X	X	X	X
Complete SCART in/out switching matrix	X	X	X	X
Three I^2S inputs; one I^2S output	X	X	X	X
3rd digital input (I^2S3) with multichannel capability	X	X	X	X
Digital output with multichannel capability	X	X	X	X
All analog Mono sound carriers including AM-SECAM L	X	X	X	X
All analog FM-Stereo A2 and satellite standards	X			X
Simultaneous demodulation of (very) high-deviation FM-Mono and NICAM	X			X
Adaptive deemphasis for satellite (Wegener-Panda, acc. to ASTRA specification)	X			X
ASTRA Digital Radio (ADR) together with DRP 3510A	X			X
All NICAM standards	X			X
Demodulation of the BTSC multiplex signal and the SAP channel		X	X	X
Alignment free digital DBX noise reduction for BTSC Stereo and SAP			X	X
Alignment free digital Micronas Noise Reduction (MNR) for BTSC Stereo and SAP		X		
BTSC and EIA-J stereo separation significantly better than spec.		X	X	X
SAP and stereo detection for BTSC system		X	X	X
Korean FM-Stereo A2 standard	X	X	X	X
Alignment-free Japanese standard EIA-J		X	X	X
Demodulation of the FM-Radio multiplex signal		X	X	X

1.2. MSP 44x0G Version List

Table 1–1: MSP 44x0G Version List

Version	Status	Description
MSP 4410G	not confirmed	NICAM and FM Stereo (A2) Version
MSP 4420G	not confirmed	NTSC Version (A2 Korea, BTSC with Micronas Noise Reduction (MNR), and Japanese EIA-J System)
MSP 4440G	not confirmed	NTSC Version (A2 Korea, BTSC with DBX Noise Reduction, and Japanese EIA-J System)
MSP 4450G	available	Global Version (all sound standards)

1.3. MSP 44x0G Versions and their Application Fields

Table 1–2 provides an overview of TV sound standards that can be processed by the MSP 44x0G family. In addition, the MSP 44x0G is able to handle the FM-Radio standard. With the MSP 44x0G, a complete multimedia receiver covering all TV sound standards together with terrestrial/cable and satellite radio sound can be built; even ASTRA Digital Radio can be processed (with a DRP 3510A coprocessor).

Table 1–2: TV Stereo Sound Standards covered by the MSP 44x0G IC Family (details see Appendix A)

MSP Version			TV-System	Position of Sound Carrier /MHz	Sound Modulation	Color System	Broadcast e.g. in:
	4410	4450	B/G	5.5/5.7421875	FM-Stereo (A2)	PAL	Germany
				5.5/5.85	FM-Mono/NICAM	PAL	Scandinavia, Spain
			L	6.5/5.85	AM-Mono/NICAM	SECAM-L	France
			I	6.0/6.552	FM-Mono/NICAM	PAL	UK, Hong Kong
			D/K	6.5/6.2578125	FM-Stereo (A2, D/K1)	SECAM-East	Slovak. Rep.
				6.5/6.7421875	FM-Stereo (A2, D/K2)	PAL	currently no broadcast
				6.5/5.7421875	FM-Stereo (A2, D/K3)	SECAM-East	Poland
				6.5/5.85	FM-Mono/NICAM (D/K, NICAM)	PAL	China, Hungary
			Satellite	6.5 7.02/7.2 7.38/7.56 etc.	FM-Mono FM-Stereo ASTRA Digital Radio (ADR) with DRP 3510A	PAL	Europe Sat. ASTRA
4420, 4440			M/N	4.5/4.724212	FM-Stereo (A2)	NTSC	Korea
				4.5	FM-FM (EIA-J)	NTSC	Japan
				4.5	BTSC-Stereo + SAP	NTSC, PAL	USA, Argentina
			FM-Radio	10.7	FM-Stereo Radio		USA, Europe

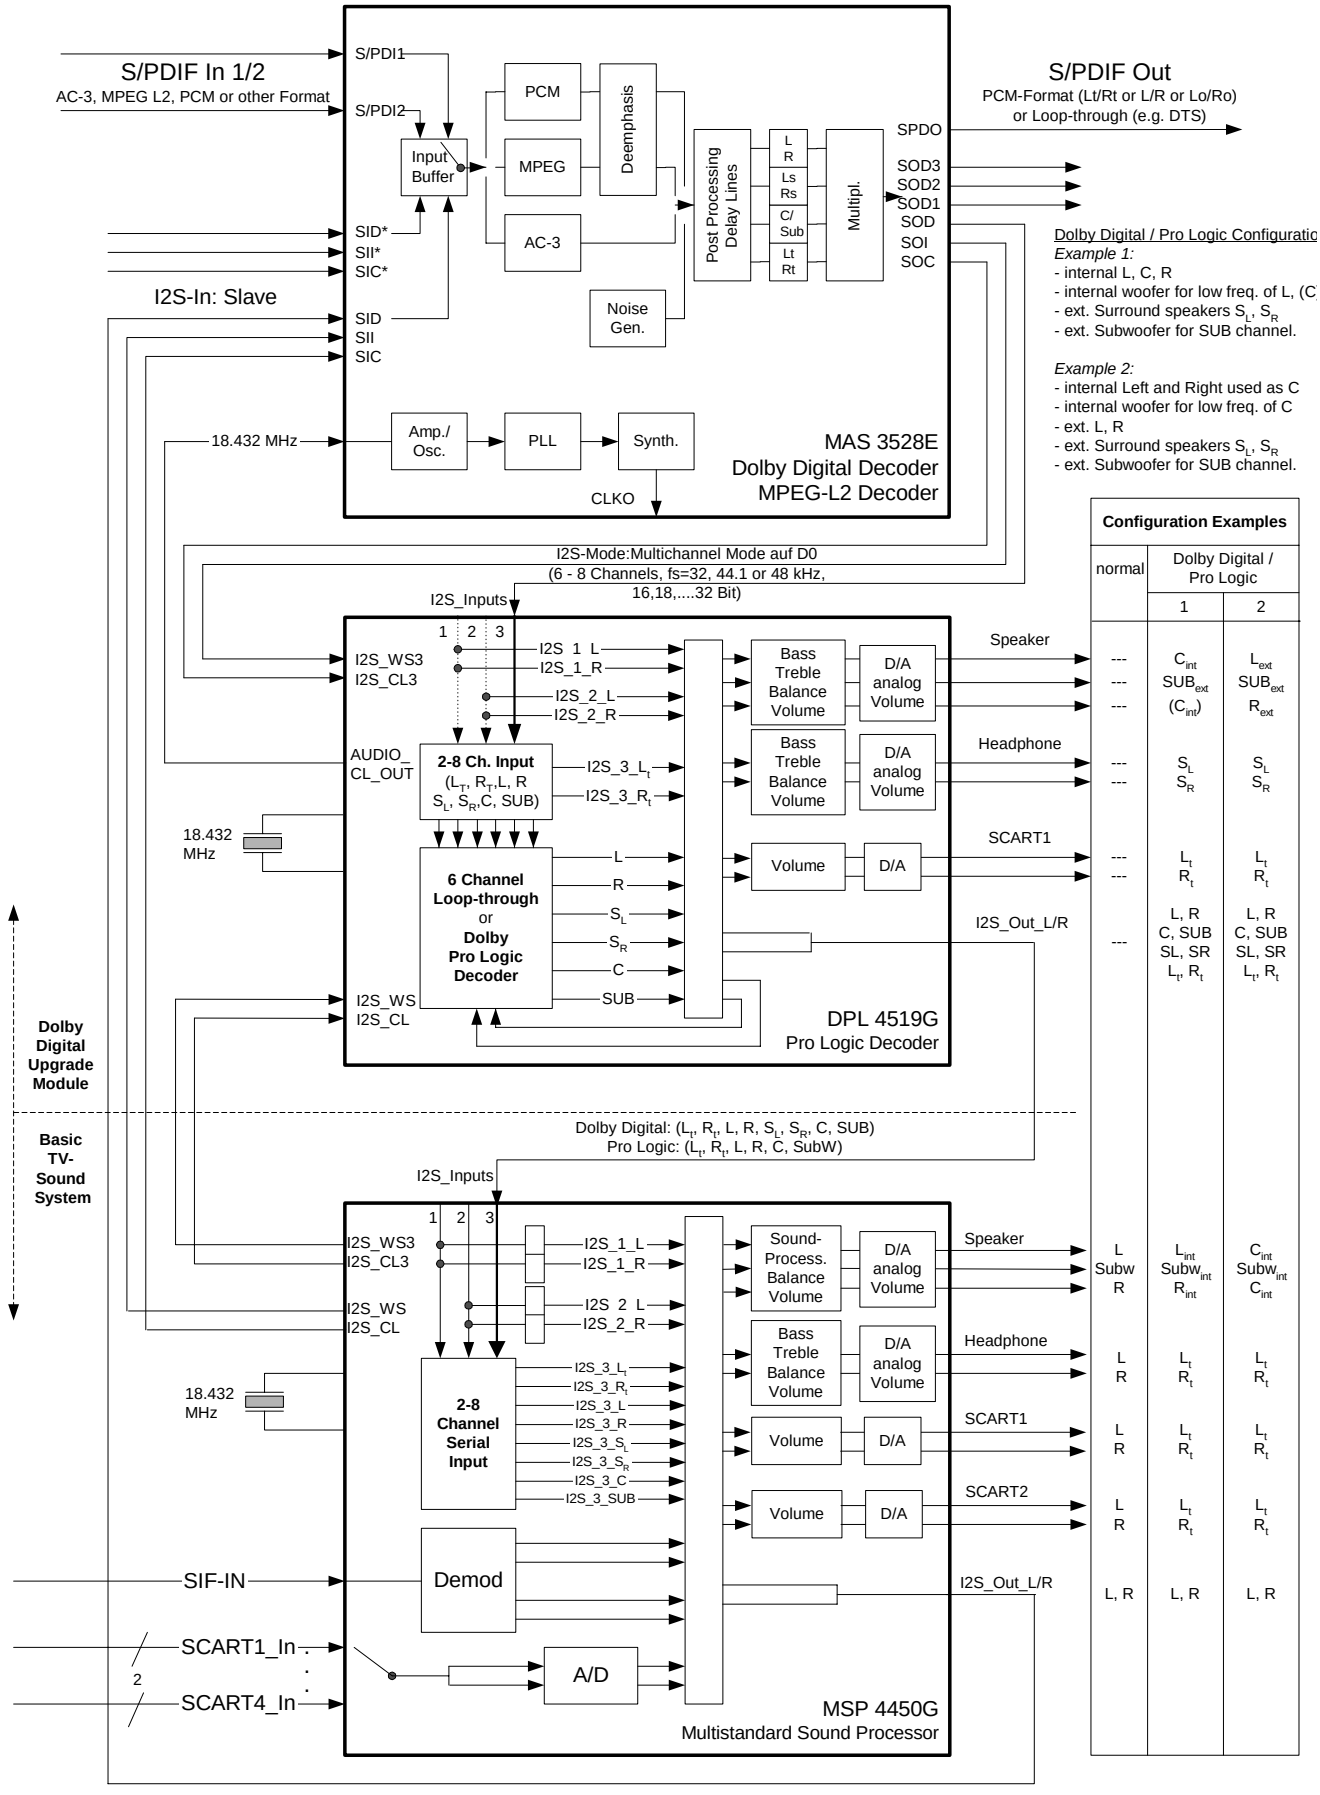

Fig. 1–2: Typical MSP 44x0G application

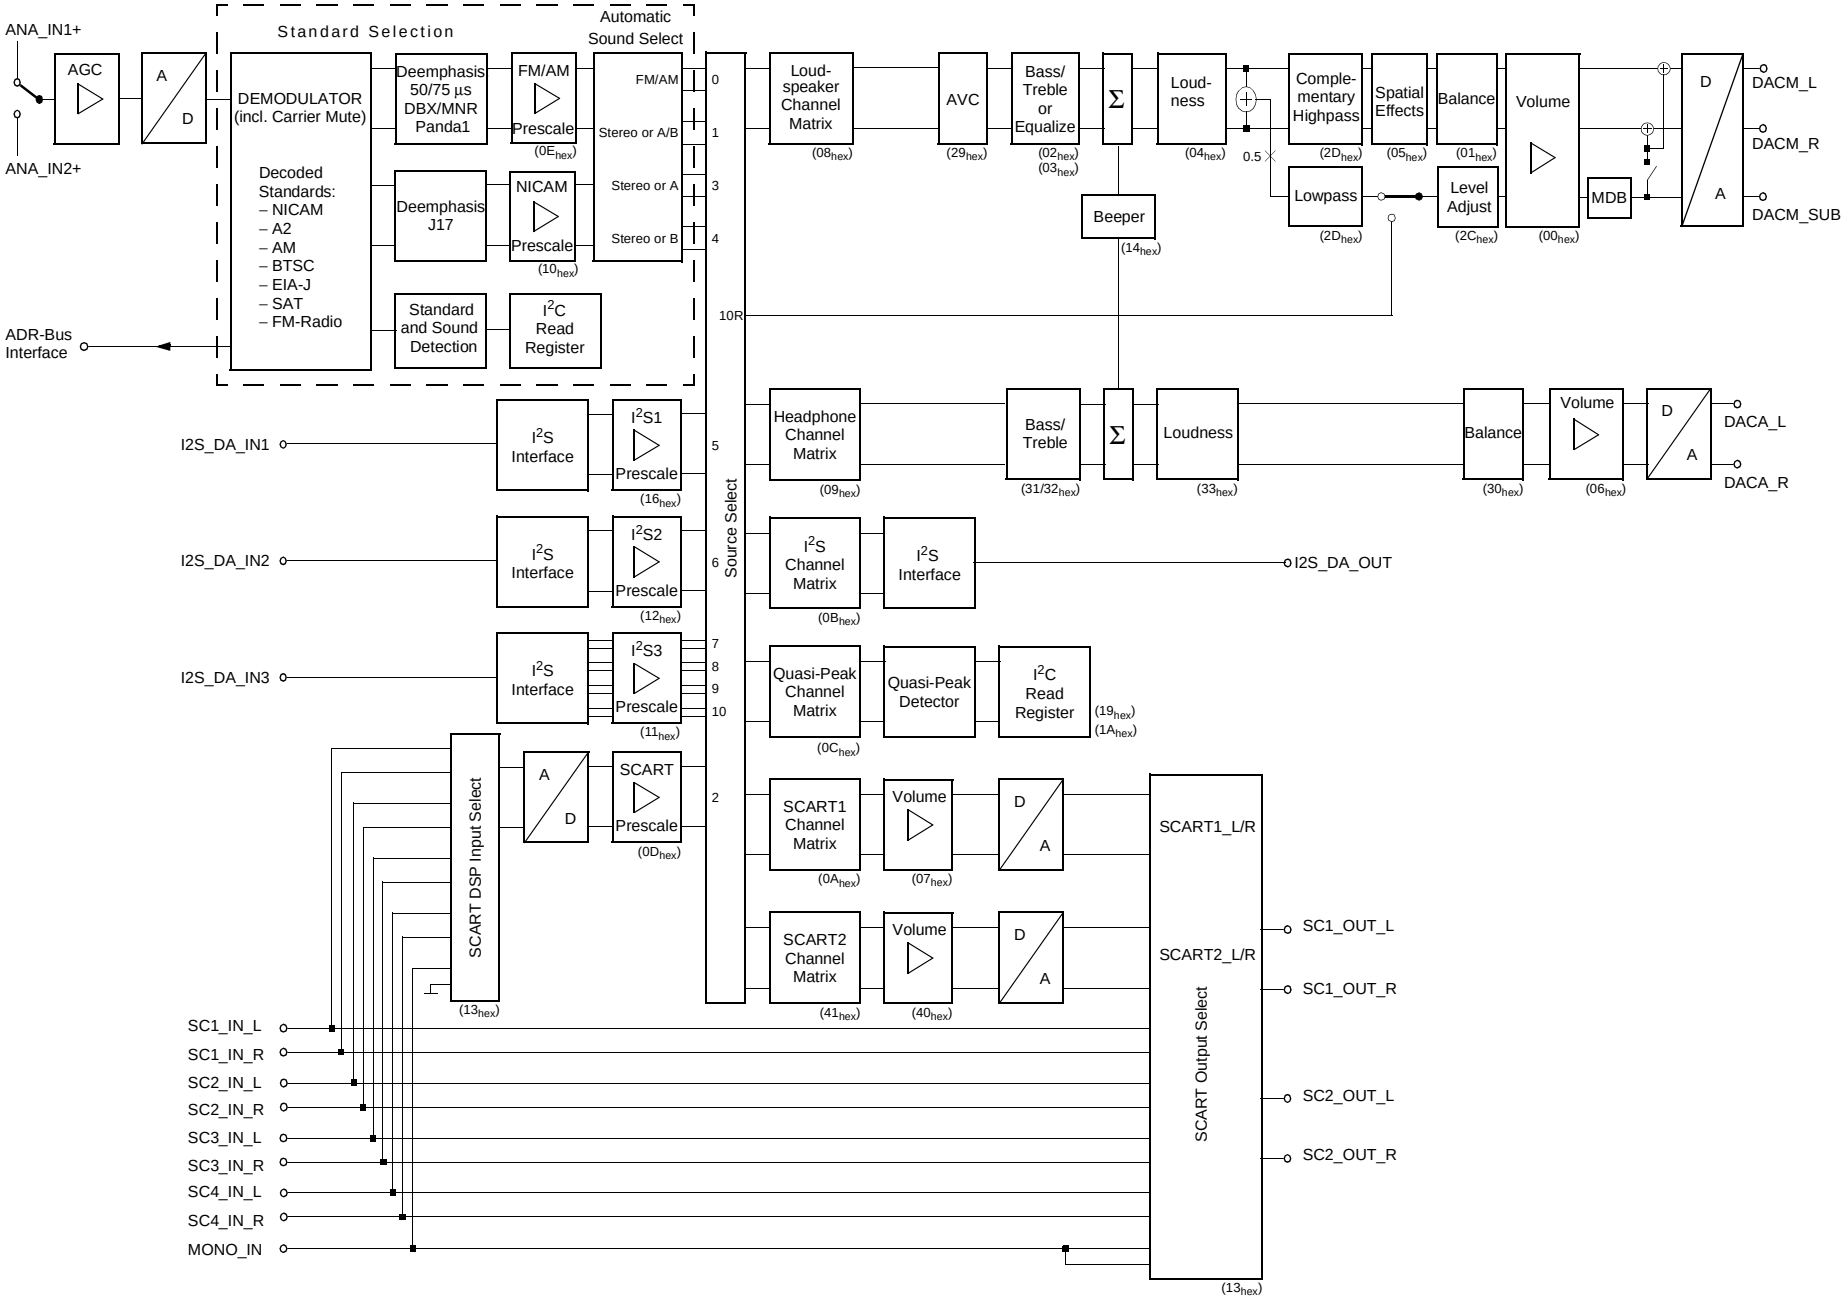

Fig. 2–1: Signal flow block diagram of the MSP 44x0G (input and output names correspond to pin names)

2.1. Architecture of the MSP 44x0G Family

Fig. 2–1 on page 10 shows a simplified block diagram of the IC. The block diagram contains all features of the MSP 4450G. Other members of the MSP 44x0G family do not have the complete set of features: The demodulator handles only a subset of the standards presented in the demodulator block; NICAM processing is only possible in the MSP 4410G and MSP 4450G.

2.2. Sound IF Processing

2.2.1. Analog Sound IF Input

The input pins ANA_IN1+, ANA_IN2+, and ANA_IN– offer the possibility to connect two different sound IF (SIF) sources to the MSP 44x0G. The analog-to-digital conversion of the preselected sound IF signal is done by an A/D-converter. An analog automatic gain circuit (AGC) allows a wide range of input levels. The high-pass filters formed by the coupling capacitors at pins ANA_IN1+ and ANA_IN2+ (see Section 7.4. “Application Circuit” on page 99) are sufficient in most cases to suppress video components. Some combinations of SAW filters and sound IF mixer ICs, however, show large picture components on their outputs. In this case, further filtering is recommended.

2.2.2. Demodulator: Standards and Features

The MSP 44x0G is able to demodulate all TV-sound standards worldwide including the digital NICAM system. Depending on the MSP 44x0G version, the following demodulation modes can be performed:

A2 Systems: Detection and demodulation of two separate FM carriers (FM1 and FM2), demodulation and evaluation of the identification signal of carrier FM2.

NICAM Systems: Demodulation and decoding of the NICAM carrier, detection and demodulation of the analog (FM or AM) carrier. For D/K-NICAM, the FM carrier may have a maximum deviation of 384 kHz.

Very high deviation FM-Mono: Detection and robust demodulation of one FM carrier with a maximum deviation of 540 kHz.

BTSC-Stereo: Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, AM demodulation of the (L–R)-carrier and detection of the SAP subcarrier. Processing of DBX noise reduction or Micronas Noise Reduction (MNR).

BTSC-Mono + SAP: Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, detection and FM demodulation of the SAP subcarrier. Processing of DBX noise reduction or Micronas Noise Reduction (MNR).

Japan Stereo: Detection and FM demodulation of the aural carrier resulting in the MPX signal. Demodulation and evaluation of the identification signal and FM demodulation of the (L–R)-carrier.

FM-Satellite Sound: Demodulation of one or two FM carriers. Processing of high-deviation mono or narrow bandwidth mono, stereo, or bilingual satellite sound according to the ASTRA specification.

FM-Stereo-Radio: Detection and FM demodulation of the aural carrier resulting in the MPX signal. Detection and evaluation of the pilot carrier and AM demodulation of the (L–R)-carrier.

The demodulator blocks of all MSP 44x0G versions have identical user interfaces. Even completely different systems like the BTSC and NICAM systems are controlled the same way. Standards are selected by means of MSP Standard Codes. Automatic processes handle standard detection and identification without controller interaction. The key features of the MSP 44x0G demodulator blocks are:

Standard Selection: The controlling of the demodulator is minimized: All parameters, such as tuning frequencies or filter bandwidth, are adjusted automatically by transmitting one single value to the STANDARD SELECT register. For all standards, specific MSP standard codes are defined.

Automatic Standard Detection: If the TV sound standard is unknown, the MSP 44x0G can automatically detect the actual standard, switch to that standard, and respond the actual MSP standard code.

Automatic Carrier Mute: To prevent noise effects or FM identification problems in the absence of an FM carrier, the MSP 44x0G offers a configurable carrier mute feature, which is activated automatically if the TV sound standard is selected by means of the STANDARD SELECT register. If no FM carrier is detected at one of the two MSP demodulator channels, the corresponding demodulator output is muted. This is indicated in the STATUS register.

2.2.3. Preprocessing of Demodulator Signals

The NICAM signals must be processed by a deemphasis filter and adjusted in level. The analog demodulated signals must be processed by a deemphasis filter, adjusted in level, and dematrixed. The correct deemphasis filters are already selected by setting the standard in the STANDARD SELECT register. The level adjustment has to be done by means of the FM/AM and NICAM prescale registers. The necessary dematrix function depends on the selected sound standard and the actual broadcasted sound mode (mono, stereo, or bilingual). It can be manually set by the FM Matrix Mode register or automatically by the Automatic Sound Selection.

2.2.4. Automatic Sound Select

In the Automatic Sound Select mode, the dematrix function is automatically selected based on the identification information in the STATUS register. No I^2C interaction is necessary when the broadcasted sound mode changes (e.g. from mono to stereo).

The demodulator supports the identification check by switching between mono-compatible standards (standards that have the same FM-Mono carrier) automatically and non-audible. If B/G-FM or B/G-NICAM is selected, the MSP will switch between these standards. The same action is performed for the standards: D/K1-FM, D/K2-FM, D/K3-FM and D/K-NICAM. Switching is only done in the absence of any stereo or bilingual identification. If identification is found, the MSP keeps the detected standard.

In case of high bit-error rates, the MSP 44x0G automatically falls back from digital NICAM sound to analog FM or AM mono.

Table 2–1 summarizes all actions that take place when Automatic Sound Select is switched on.

To provide more flexibility, the Automatic Sound Select block prepares four different source channels of demodulated sound (Fig. 2–2). By choosing one of the four demodulator channels, the preferred sound mode can be selected for each of the output channels (loudspeaker, headphone, etc.). This is done by means of the Source Select registers.

The following source channels of demodulated sound are defined:

– **“FM/AM” channel:** Analog mono sound, stereo if available. In case of NICAM, analog mono only (FM or AM mono).

– **“Stereo or A/B” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains both languages A (left) and B (right).

– **“Stereo or A” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language A (on left and right).

– **“Stereo or B” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language B (on left and right).

Fig. 2–2 and Table 2–2 show the source channel assignment of the demodulated signals in case of Automatic Sound Select mode for all sound standards.

Note: The analog primary input channel contains the signal of the mono FM/AM carrier or the L+R signal of the MPX carrier. The secondary input channel contains the signal of the 2nd FM carrier, the L-R signal of the MPX carrier, or the SAP signal.

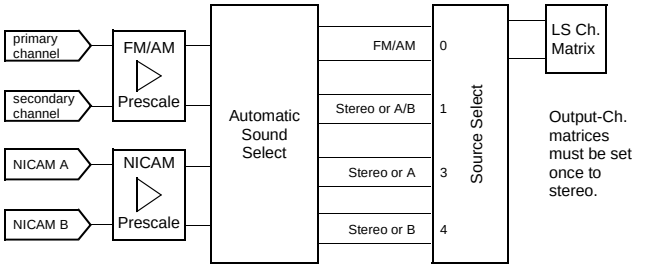

Fig. 2–2: Source channel assignment of demodulated signals in Automatic Sound Select Mode

2.2.5. Manual Mode

Fig. 2–3 shows the source channel assignment of demodulated signals in case of manual mode. If manual mode is required, more information can be found in Section 6.7. “Demodulator Source Channels in Manual Mode” on page 96.

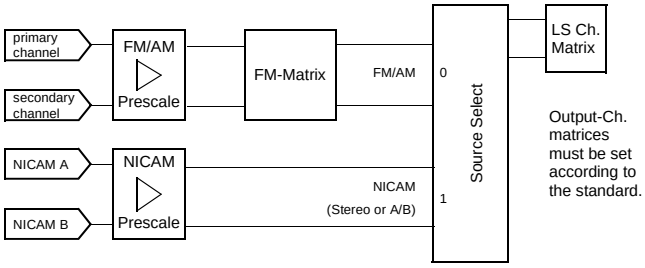

Fig. 2–3: Source channel assignment of demodulated signals in Manual Mode

2.3. Preprocessing for SCART and I^2S Input Signals

The SCART and I^2S inputs need only be adjusted in level by means of the SCART and I^2S prescale registers.

Table 2–1: Performed actions of the Automatic Sound Selection

Selected TV Sound Standard	Performed Actions
B/G-FM, D/K-FM, M-Korea, and M-Japan	Evaluation of the identification signal and automatic switching to mono, stereo, or bilingual. Preparing four demodulator source channels according to Table 2–2.
B/G-NICAM, L-NICAM, I-NICAM, D/K-NICAM	Evaluation of NICAM-C-bits and automatic switching to mono, stereo, or bilingual. Preparing four demodulator source channels according to Table 2–2.
	In case of bad or no NICAM reception, the MSP switches automatically to FM/AM mono and switches back to NICAM if possible. A hysteresis prevents periodical switching.
B/G-FM, B/G-NICAM or D/K1-FM, D/K2-FM, D/K3-FM, and D/K-NICAM	Automatic searching for stereo/bilingual-identification in case of mono transmission. Automatic and non-audible changes between Dual-FM and FM-NICAM standards while listening to the basic FM-mono sound carrier. Example: If starting with B/G-FM-Stereo, there will be a periodical alternation to B/G-NICAM in the absence of FM-Stereo/Bilingual or NICAM-identification. Once an identification is detected, the MSP keeps the corresponding standard.
BTSC-STEREO, FM Radio	Evaluation of the pilot signal and automatic switching to mono or stereo. Preparing four demodulator source channels according to Table 2–2. Detection of the SAP carrier.
M-BTSC-SAP	In the absence of SAP, the MSP switches to BTSC-stereo if available. If SAP is detected, the MSP switches automatically to SAP (see Table 2–2).

Table 2–2: Sound modes for the demodulator source channels with Automatic Sound Select

			Source Channels in Automatic Sound Select Mode			
Broadcasted Sound Standard	**Selected MSP Standard Code**[3)]	**Broadcasted Sound Mode**	**FM/AM** (source select: 0)	**Stereo or A/B** (source select: 1)	**Stereo or A** (source select: 3)	**Stereo or B** (source select: 4)
M-Korea B/G-FM D/K-FM M-Japan	02 03, 08[1)] 04, 05, 07, 0B[1)] 30	MONO	Mono	Mono	Mono	Mono
		STEREO	Stereo	Stereo	Stereo	Stereo
		BILINGUAL: Languages A and B	Right = B	Left = A Right = B	A	B
B/G-NICAM L-NICAM I-NICAM D/K-NICAM D/K-NICAM (with high deviation FM)	08, 03[2)] 09 0A 0B, 04[2)], 05[2)] 0C, 0D	NICAM not available or error rate too high	analog Mono	analog Mono	analog Mono	analog Mono
		MONO	analog Mono	NICAM Mono	NICAM Mono	NICAM Mono
		STEREO	analog Mono	NICAM Stereo	NICAM Stereo	NICAM Stereo
		BILINGUAL: Languages A and B	analog Mono	Left = NICAM A Right = NICAM B	NICAM A	NICAM B
BTSC	20, 21	MONO	Mono	Mono	Mono	Mono
		STEREO	Stereo	Stereo	Stereo	Stereo
	20	MONO + SAP	Mono	Mono	Mono	Mono
		STEREO + SAP	Stereo	Stereo	Stereo	Stereo
	21	MONO + SAP	Left = Mono Right = SAP	Left = Mono Right = SAP	Mono	SAP
		STEREO + SAP	Left = Mono Right = SAP	Left = Mono Right = SAP	Mono	SAP
FM Radio	40	MONO	Mono	Mono	Mono	Mono
		STEREO	Stereo	Stereo	Stereo	Stereo

[1)] The Automatic Sound Select process will automatically switch to the mono compatible analog standard.

[2)] The Automatic Sound Select process will automatically switch to the mono compatible digital standard.

[3)] The MSP Standard Codes are defined in (see Table 3–7 on page 24).

2.4. Source Selection and Output Channel Matrix

The Source Selector makes it possible to distribute all source signals (one of the demodulator source channels, SCART, or I^2S input) to the desired output channels (loudspeaker, headphone, etc.). All input and output signals can be processed simultaneously. Each source channel is identified by a unique source address.

For each output channel, the sound mode can be set to sound A, sound B, stereo, or mono by means of the output channel matrix.

If Automatic Sound Select is on, the output channel matrix can stay fixed to stereo (transparent) for demodulated signals.

2.5. Audio Baseband Processing

2.5.1. Automatic Volume Correction (AVC)

Different sound sources (e.g. terrestrial channels, SAT channels, or SCART) fairly often do not have the same volume level. Advertisements during movies usually have a higher volume level than the movie itself. This results in annoying volume changes. The Automatic Volume Correction (AVC) solves this problem by equalizing the volume level.

To prevent clipping, the AVC's gain decreases quickly in dynamic boost conditions. To suppress oscillation effects, the gain increases rather slowly for low level inputs. The decay time is programmable by means of the AVC register (see page 34).

For input signals ranging from –24 dBr to 0 dBr, the AVC maintains a fixed output level of –18 dBr. Fig. 2–4 shows the AVC output level versus its input level. For prescale and volume registers set to 0 dB, a level of 0 dBr corresponds to full scale input/output. This is

– SCART input/output 0 dBr = 2.0 V_{rms}

– Loudspeaker and Aux output 0 dBr = 1.4 V_{rms}

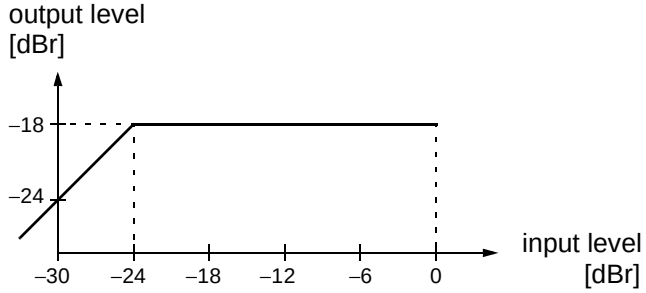

Fig. 2–4: Simplified AVC characteristics

2.5.2. Loudspeaker and Headphone Outputs

The following baseband features are implemented in the loudspeaker and headphone output channels: bass/treble, loudness, balance, and volume. A square wave beeper can be added to the loudspeaker and headphone channel. The loudspeaker channel additionally performs: equalizer (not simultaneously with bass/treble), spatial effects, and a subwoofer crossover filter.

2.5.3. Subwoofer Output

The subwoofer signal is created by combining the left and right channels directly behind the loudness block using the formula (L+R)/2. Due to the division by 2, the D/A converter will not be overloaded, even with full scale input signals. The subwoofer signal is filtered by a third-order low-pass with programmable corner frequency followed by a level adjustment. At the loudspeaker channels, a complementary high-pass filter can be switched on. Subwoofer and loudspeaker output use the same volume (Loudspeaker Volume Register).

2.5.4. Quasi-Peak Detector

The quasi-peak readout register can be used to read out the quasi-peak level of any input source. The feature is based on following filter time constants:

attack time: 1.3 ms
decay time: 37 ms

2.5.5. Micronas Dynamic Bass (MDB)

The **M**icronas **D**ynamic **B**ass system (MDB) extends the frequency range of loudspeakers or headphones.

After the adaption of MDB to the loudspeakers and the cabinet, further customizing of MDB allows individual fine tuning of the sound.

The MDB is placed in the subwoofer path. For applications without a subwoofer, the enhanced bass signal can be added back onto the Left/Right channels (see Fig. 2–1 on page 10). Micronas Dynamic Bass combines two effects: Dynamic Amplification and Adding Harmonics.

2.5.5.1. Dynamic Amplification

Low frequency signals can be boosted while the output signal amplitude is measured. If the amplitude comes close to a definable limit, the gain is reduced automatically in dynamic Volume mode. Therefore, the system adapts to the signal amplitude which is really present at the output of the MSP device. Clipping effects are avoided.

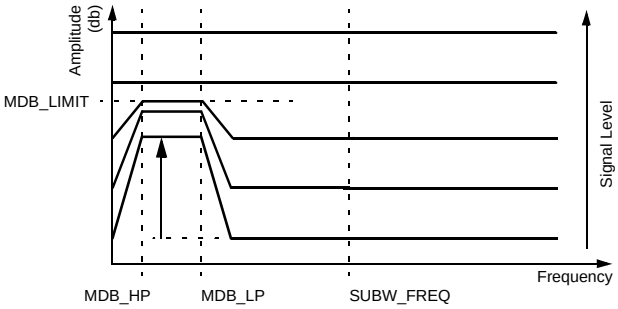

Fig. 2–5: Dynamic Amplification

2.5.5.2. Adding Harmonics

MDB exploits the psychoacoustic phenomenon of the ‘missing fundamental’. Adding harmonics of the frequency components below the cutoff frequency gives the impression of actually hearing the low frequency fundamental. In other words: The listener has the impression that a loudspeaker system seems to reproduce frequencies although physically not possible.

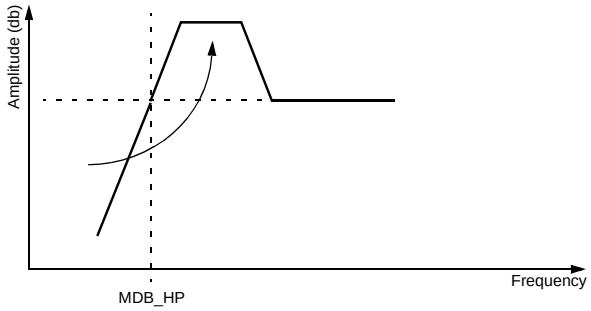

Fig. 2–6: Adding Harmonics

2.5.5.3. MDB Parameters

Several parameters allow tuning the characteristics of MDB according to the TV loudspeaker, the cabinet, and personal preferences (see Table 3–11). For more detailed information on how to set up MDB, please refer to the corresponding application note on the Micronas homepage.

2.6. SCART Signal Routing

2.6.1. SCART DSP In and SCART Out Select

The SCART DSP Input Select and SCART Output Select blocks include full matrix switching facilities. To design a TV set with four pairs of SCART-inputs and two pairs of SCART-outputs, no external switching hardware is required. The switches are controlled by the ACB user register (see page 42).

2.6.2. Stand-by Mode

If the MSP 44x0G is switched off by first pulling STANDBYQ low and then (after >1 µs delay) switching off DVSUP and AVSUP, but keeping AHVSUP (‘**Stand-by’-mode**), the SCART switches maintain their position and function. This allows the copying from SCART-input to SCART-output in the TV set’s stand-by mode.

In case of power on or starting from stand-by (switching on the DVSUP and AVSUP, RESETQ going high 2 ms later), all internal registers except the ACB register (see page 42) are reset to the default configuration (see Table 3–5 on page 21). The reset position of the ACB register becomes active after the first I^2C transmission into the Baseband Processing part. By transmitting the ACB register first, the reset state can be redefined.

2.7. I²S Bus Interfaces

The MSP 44x0G has three I²S bus input data lines and one I²S bus output data line. They are all operated in 48 kHz mode.

Together with I2S_WS/CL or I2S_WS3/CL3, the data lines form two I²S bus interfaces with various operational modes.

Both interfaces work in synchronous master or slave mode. They accept a variety of formats with different sample width, bit-orientation, and wordstrobe timing. All I²S options are set by means of the MODUS and the I²S_CONFIG register.

The different operational modes are described in the following sections.

2.7.1. Two-Channel I²S-Input

The two I²S bus input lines 1 and 2 are capable of receiving two channel I²S signals. The interface consist of the pins:

– I2S_DA_IN1, I2S_DA_IN2/3 (I2S_DA_IN2 in PQFP80 package):
I²S serial data input, 16, 18...32 bits per sample

– I2S_CL:
I²S serial clock

– I2S_WS
I²S word strobe signal, defines left and right sample.

If the MSP 44x0G serves as master on this I²S interface (active), the clock and word strobe lines are driven by the MSP 44x0G. Depending on the I²S output definition (section 2.7.3.), the interface is switched to a different wordlength. If the I²S output is set to 2*16 bit, it works with 2*16bit MSB bound. In case of 2*32 or 8*32 bits, the first 18 bits after each WS Slope are used.

In slave mode, I2S_CL and I2S_WS are input to the MSP 44x0G (tristate) and the MSP 44x0G clock is synchronized to 384 times the I2S_WS rate (48 kHz).

NICAM operation is not possible in slave mode. An I²S timing diagram is shown in Fig. 4–24 on page 67.

2.7.2. Multichannel I²S-Input

2.7.2.1. Using I2S_DA_IN3

The MSP 44x0G is capable of receiving signals with up to eight audio channels. The corresponding I²S bus interface consist of the pins:

– I2S_DA_IN2/3 (I2S_DA_IN3 in PQFP80 package):
I²S serial data input, 16, 18...32 bits per sample

– I2S_CL3: I²S serial clock

– I2S_WS3:
I²S word strobe signal, defines frame start

In multichannel input mode, the number of channels must be even and less or equal eight. If CL and WS are active (master mode) only, eight-channel mode is available. Channel Select matrix I2S3-1/2 to I2S3-7/8 are used as input ports.

I2S_DA_IN1, I2S_DA_IN2, I2S_CL, and I2S_WS are available simultaneously for two-channel input.

2.7.2.2. Using I2S_DA_IN1/2/3

All I²S input lines (I2S_DA_IN1, I2S_DA_IN2, and I2S_DA_IN3 in PQFP80 package) can be used in parallel in two-channel mode to transmit six channels simultaneously. The interface consist of the pins:

– I2S_DA_IN1, I2S_DA_IN2, I2S_DA_IN3:
I²S serial data input, 16, 18...32 bits per sample

– I2S_CL3: I²S serial clock

– I2S_WS3:
I²S word strobe signal, defines left and right sample

Channel Select matrix I2S3-1/2 to I2S3-5/6 are used as input ports. I2S1 and I2S2 inputs are not available in this mode.

2.7.3. Two or Eight-Channel I²S-Output

Bit[0:1] of the I2S CONFIG register (see page 28) switches the output to two-channel or eight-channel multichannel output mode. The bit resolution per channel is 16 or 32-bit in master mode. The first two channels can be selected on the source select matrix. Channel 2 is repeated six times (e.g. L,R,R,R,R,R,R). The multichannel output mode is used to connect with interfaces not working in two-channel mode. Both master and slave mode are possible as long as the wordstrobe has only one positive edge per frame in slave mode. The interface consist of the pins:

– I2S_DA_OUT:
I²S serial data otuput, 16 or 32 bits per sample

– I2S_CL: I²S serial clock

– I2S_WS:
I²S word strobe signal defines left and right sample

Note: The I2S_DA_IN1 and I2S_DA_IN2 input buffers are filled with the first 18 bits after each WS Slope.

An I²S timing diagram is shown in Fig. 4–25 on page 68.

2.8. ADR Bus Interface

For the ASTRA Digital Radio System (ADR), the MSP 4410G, and MSP 4450G performs preprocessing such as carrier selection and filtering. Via the 3-line ADR-bus, the resulting signals are transferred to the DRP 3510A coprocessor, where the source decoding is performed. To be prepared for an upgrade to ADR with an additional DRP board, the following lines of MSP 44x0G should be provided on a feature connector:

– AUD_CL_OUT

– I2S_DA_IN1 or I2S_DA_IN2

– I2S_DA_OUT

– I2S_WS

– I2S_CL

– ADR_CL, ADR_WS, ADR_DA

For more details, please refer to the DRP 3510A data sheet.

2.9. Digital Control I/O Pins and Status Change Indication

The static level of the digital input/output pins D_CTR_I/O_0/1 is switchable between HIGH and LOW via the I^2C-bus by means of the ACB register (see page 42). This enables the controlling of external hardware switches or other devices via I^2C-bus.

The digital input/output pins can be set to high impedance by means of the MODUS register (see page 27). In this mode, the pins can be used as input. The current state can be read out of the STATUS register (see page 29).

Optionally, the pin D_CTR_I/O_1 can be used as an interrupt request signal to the controller, indicating any changes in the read register STATUS. This makes polling unnecessary, I^2C bus interactions are reduced to a minimum (see “STATUS Register” on page 29 and “MODUS Register” on page 27).

2.10. Clock PLL Oscillator and Crystal Specifications

The MSP 44x0G derives all internal system clocks from the 18.432 MHz oscillator. In NICAM or in I^2S-Slave mode, the clock is phase-locked to the corresponding source. Therefore, it is not possible to use NICAM and I^2S-Slave mode at the same time.

For proper performance, the MSP clock oscillator requires a 18.432 MHz crystal. Note that for the phase-locked modes (NICAM, I^2S-Slave), crystals with tighter tolerance are required.

3. Control Interface

3.1. I²C Bus Interface

The MSP 44x0G is controlled via the I²C bus slave interface.

The IC is selected by transmitting one of the MSP 44x0G device addresses. In order to allow up to three MSP ICs to be connected to a single bus, an address select pin (ADR_SEL) has been implemented. With ADR_SEL pulled to high, low, or left open, the MSP 44x0G responds to different device addresses. A device address pair is defined as a write address and a read address (see Table 3–1).

Writing is done by sending the write device address, followed by the subaddress byte, two address bytes, and two data bytes.

Reading is done by sending the write device address, followed by the subaddress byte and two address bytes. Without sending a stop condition, reading of the addressed data is completed by sending the device read address and reading two bytes of data.

Refer to Section 3.1.3. for the I²C bus protocol and to Section 3.4. “Programming Tips” on page 44 for proposals of MSP 44x0G I²C telegrams. See Table 3–2 for a list of available subaddresses.

Besides the possibility of hardware reset, the MSP can also be reset by means of the RESET bit in the CONTROL register by the controller via I²C bus.

Due to the architecture of the MSP 44x0G, the IC cannot react immediately to an I²C request. The typical response time is about 0.3 ms. If the MSP cannot accept another byte of data (e.g. while servicing an internal interrupt), it holds the clock line I2C_CL low to force the transmitter into a wait state. The I²C Bus Master must read back the clock line to detect when the MSP is ready to receive the next I²C transmission. The positions within a transmission where this may happen are indicated by ’Wait’ in Section 3.1.3. The maximum wait period of the MSP during normal operation mode is less than 1 ms.

3.1.1. Internal Hardware Error Handling

In case of any hardware problems (e.g. interruption of the power supply of the MSP), the MSP’s wait period is extended to 1.8 ms. After this time period elapses, the MSP releases data and clock lines.

Indication and solving the Error Status:

To indicate the error status, the remaining acknowledge bits of the actual I²C-protocol will be left high. Additionally, bit[14] of CONTROL is set to one. The MSP can then be reset via the I²C bus by transmitting the RESET condition to CONTROL.

Indication of Reset:

Any reset, even caused by an unstable reset line etc., is indicated in bit[15] of CONTROL.

A general timing diagram of the I²C bus is shown in Fig. 4–23 on page 65.

Table 3–1: I²C Bus device addresses

ADR_SEL	Low (connected to DVSS)		High (connected to DVSUP)		Left Open	
Mode	**Write**	**Read**	**Write**	**Read**	**Write**	**Read**
MSP device address	80_{hex}	81_{hex}	84_{hex}	85_{hex}	88_{hex}	89_{hex}

Table 3–2: I²C Bus subaddresses

Name	Binary Value	Hex Value	Mode	Function
CONTROL	0000 0000	00	Read/Write	Write: Software reset of MSP (see Table 3–3) Read: Hardware error status of MSP
WR_DEM	0001 0000	10	Write	write address demodulator
RD_DEM	0001 0001	11	Write	read address demodulator
WR_DSP	0001 0010	12	Write	write address DSP
RD_DSP	0001 0011	13	Write	read address DSP

3.1.2. Description of CONTROL Register

Table 3–3: CONTROL as a write register

Name	Subaddress	Bit[15] (MSB)	Bits[14:0]
CONTROL	00_{hex}	1 : RESET 0 : normal	0

Table 3–4: CONTROL as a read register

Name	Subaddress	Bit[15] (MSB)	Bit[14]	Bits[13:0]
CONTROL	00_{hex}	RESET status after last reading of CONTROL: 0 : no reset occured 1 : reset occured	Internal hardware status: 0 : no error occured 1 : internal error occured	not of interest
Reading of CONTROL will reset the bits[15,14] of CONTROL. After Power-on, bit[15] of CONTROL will be set; it must be read once to be reset.				

3.1.3. Protocol Description

Write to DSP or Demodulator

S	write device address	Wait	ACK	sub-addr	ACK	addr-byte high	ACK	addr-byte low	ACK	data-byte high	ACK	data-byte low	ACK	P

Read from DSP or Demodulator

S	write device address	Wait	ACK	sub-addr	ACK	addr-byte high	ACK	addr-byte low	ACK	S	read device address	Wait	ACK	data-byte-high	ACK	data-byte low	NAK	P

Write to Control Register

S	write device address	Wait	ACK	sub-addr	ACK	data-byte high	ACK	data-byte low	ACK	P

Read from Control Register

S	write device address	Wait	ACK	00hex	ACK	S	read device address	Wait	ACK	data-byte-high	ACK	data-byte low	NAK	P

Note: S = I^2C-Bus Start Condition from master
P = I^2C-Bus Stop Condition from master
ACK = Acknowledge-Bit: LOW on I2C_DA from slave (= MSP, light gray) or master (= controller, dark gray)
NAK = Not Acknowledge-Bit: HIGH on I2C_DA from master (dark gray) to indicate ‘End of Read’ or from MSP indicating internal error state
Wait = I^2C-Clock line is held low, while the MSP is processing the I^2C command. This waiting time is max. 1 ms

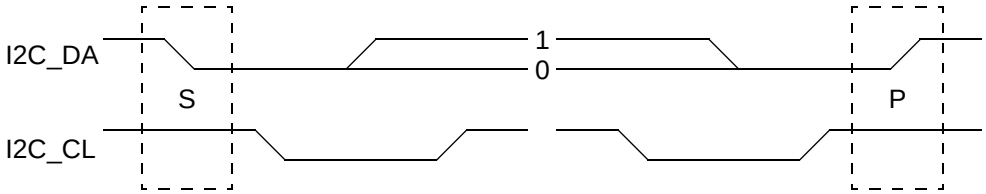

Fig. 3–1: I^2C bus protocol (MSB first; data must be stable while clock is high)

3.1.4. Proposals for General MSP 44x0G I^2C Telegrams

3.1.4.1. Symbols

daw	write device address (80_{hex}, 84_{hex} or 88_{hex})
dar	read device address (81_{hex}, 85_{hex} or 89_{hex})
<	Start Condition
>	Stop Condition
aa	Address Byte
dd	Data Byte

3.1.4.2. Write Telegrams

<daw 00 d0 00>	write to CONTROL register
<daw 10 aa aa dd dd>	write data into demodulator
<daw 12 aa aa dd dd>	write data into DSP

3.1.4.3. Read Telegrams

<daw 00 <dar dd dd>	read data from CONTROL register
<daw 11 aa aa <dar dd dd>	read data from demodulator
<daw 13 aa aa <dar dd dd>	read data from DSP

3.1.4.4. Examples

<80 00 80 00>	RESET MSP statically
<80 00 00 00>	Clear RESET
<80 10 00 20 00 03>	Set demodulator to stand. 03_{hex}
<80 11 02 00 <81 dd dd>	Read STATUS
<80 12 00 08 01 20>	Set loudspeaker channel source to NICAM and Matrix to STEREO

More examples of typical application protocols are listed in Section 3.4. “Programming Tips” on page 44.

3.2. Start-Up Sequence: Power-Up and I^2C-Controlling

After POWER-ON or RESET (see Fig. 4–22), the IC is in an inactive state. All registers are in the Reset position (see Table 3–5 and Table 3–6), the analog outputs are muted. The controller has to initialize all registers for which a non-default setting is necessary.

3.3. MSP 44x0G Programming Interface

3.3.1. User Registers Overview

The MSP 44x0G is controlled by means of user registers. The complete list of all user registers are given in Table 3–5 and Table 3–6. The registers are partitioned into the Demodulator section (Subaddress 10_{hex} for writing, 11_{hex} for reading) and the Baseband Processing sections (Subaddress 12_{hex} for writing, 13_{hex} for reading).

Write and read registers are 16 bit wide, whereby the MSB is denoted bit[15]. Transmissions via I^2C bus have to take place in 16-bit words (two byte transfers, with the most significant byte transferred first). All write registers, except the demodulator write registers are readable.

Unused parts of the 16-bit write registers must be zero. **Addresses not given in this table must not be accessed.**

For reasons of software compatibility to the MSP 34xxD, a Manual/Compatibility Mode is available. More read and write registers together with a detailed description can be found in “Appendix B: Manual/Compatibility Mode” on page 82.

Table 3–5: List of MSP 44x0G write registers

Write Register	Address (hex)	Bits	Description and Adjustable Range	Reset	See Page
I^2C Subaddress = 10_{hex} ; Registers are *not* readable					
STANDARD SELECT	00 20	[15:0]	Initial Programming of the Demodulator	00 00	25

00 50	SAT-Mono (s. Table 6–18)	6.5	3400, -10, -50
00 51	SAT-Stereo (s. Table 6–18)	7.02/7.20	
00 60	SAT ADR (Astra Digital Radio)	6.12	

[1)] In case of Automatic Sound Select, the B/G-codes 3_{hex} and 8_{hex} are equivalent.
[2)] In case of Automatic Sound Select, the D/K-codes 4_{hex}, 5_{hex}, 7_{hex} and B_{hex} are equivalent.
[3)] HDEV3: Max. FM deviation must not exceed 540 kHz
[4)] HDEV2: Max. FM deviation must not exceed 360 kHz

3.3.2.1. STANDARD SELECT Register

The TV sound standard of the MSP 44x0G demodulator is determined by the STANDARD SELECT register. There are two ways to use the STANDARD SELECT register:

– Setting up the demodulator for a TV sound standard by sending the corresponding standard code with a single I^2C bus transmission.

– Starting the Automatic Standard Detection for terrestrial TV standards. This is the most comfortable way to set up the demodulator. Within 0.5 s, the detection and setup of the actual TV sound standard is performed. The detected standard can be read out of the STANDARD RESULT register by the control processor. This feature is recommended for the primary setup of a TV set. Outputs should be muted during Automatic Standard Detection.

The Standard Codes are listed in Table 3–7.

Selecting a TV sound standard via the STANDARD SELECT register initializes the demodulator. This includes: AGC-settings and carrier mute, tuning frequencies, FIR-filter settings, demodulation mode (FM, AM, NICAM), deemphasis and identification mode.

TV stereo sound standards that are unavailable for a specific MSP version are processed in analog mono sound of the standard. In that case, stereo or bilingual processing will not be possible.

For a complete setup of the TV sound processing from analog IF input to the source selection, the transmissions as shown in Section 3.5. are necessary.

For reasons of software compatibility to the MSP 34xxD, a Manual/Compatibility mode is available. A detailed description of this mode can be found on page 82.

3.3.2.2. Refresh of STANDARD SELECT Register

A general refresh of the STANDARD SELECT register is not allowed. However, the following method enables watching the MSP 44x0G “alive” status and detection of accidental resets (only versions B6 and later):

– After Power-on, bit[15] of CONTROL will be set; it must be read once to enable the reset-detection feature.

– Reading of the CONTROL register and checking the reset indicator bit[15] .

– If bit[15] is “0”, any refresh of the STANDARD SELECT register **is not allowed.**

– If bit[15] is “1”, indicating a reset, a refresh of the STANDARD SELECT register and all other MSPG registers is required.

3.3.2.3. STANDARD RESULT Register

If Automatic Standard Detection is selected in the STANDARD SELECT register, status and result of the Automatic Standard Detection process can be read out of the STANDARD RESULT register. The possible results are based on the mentioned Standard Code and are listed in Table 3–8.

In cases where no sound standard has been detected (no standard present, too much noise, strong interferers, etc.) the STANDARD RESULT register contains 00 00_{hex}. In that case, the controller has to start further actions (for example set the standard according to a preference list or by manual input).

As long as the STANDARD RESULT register contains a value greater than 07 FF_{hex}, the Automatic Standard Detection is still active. During this period, the MODUS and STANDARD SELECT register must not be written. The STATUS register will be updated when the Automatic Standard Detection has finished.

If a present sound standard is unavailable for a specific MSP-version, it detects and switches to the analog mono sound of this standard.

Example:
The MSPs 4420G and 4440G will detect a B/G-NICAM signal as standard 3 and will switch to the analog FM-Mono sound.

Table 3–8: Results of the Automatic Standard Detection

Broadcasted Sound Standard	**STANDARD RESULT Register** Read $007E_{hex}$
Automatic Standard Detection could not find a sound standard	0000_{hex}
B/G-FM	0003_{hex}
B/G-NICAM	0008_{hex}
I	$000A_{hex}$
FM-Radio	0040_{hex}
M-Korea M-Japan M-BTSC	0002_{hex} (if MODUS[14,13]=00)
	0020_{hex} (if MODUS[14,13]=01)
	0030_{hex} (if MODUS[14,13]=10)
L-AM D/K1 D/K2 D/K3	0009_{hex} (if MODUS[12]=0)
	0004_{hex} (if MODUS[12]=1)
L-NICAM D/K-NICAM	0009_{hex} (if MODUS[12]=0)
	$000B_{hex}$ (if MODUS[12]=1)
Automatic Standard Detection still active	$>07FF_{hex}$

3.3.2.4. Write Registers on I^2C Subaddress 10_{hex}

Table 3–9: Write registers on I^2C subaddress 10_{hex}

Register Address	Function	Name
00 20_{hex}	**STANDARD SELECTION Register** Defines TV-Sound or FM-Radio Standard bit[15:0] 00 01_{hex} start Automatic Standard Detection 00 02_{hex} MSP Standard Codes (see Table 3–7) ... 00 60_{hex}	STANDARD_SEL

LOUDSPEAKER AND HEADPHONE PROCESSING		
00 00_{hex} 00 06_{hex}	**Volume Loudspeaker** **Volume Headphone** bit[15:8] volume table with 1 dB step size $7F_{hex}$ +12 dB (maximum volume) $7E_{hex}$ +11 dB ... 74_{hex} +1 dB 73_{hex} 0 dB 72_{hex} –1 dB ... 02_{hex} –113 dB 01_{hex} –114 dB 00_{hex} Mute (reset condition) FF_{hex} Fast Mute (needs about 75 ms until the signal is completely ramped down) bit[7:5] higher resolution volume table 0 +0 dB 1 +0.125 dB increase in addition to the volume table ... 7 +0.875 dB increase in addition to the volume table bit[4] 0 must be set to 0 bit[3:0] clipping mode 0 reduce volume 1 reduce tone control 2 compromise 3 dynamic With large scale input signals, positive volume settings may lead to signal clipping. The MSP 44x0G loudspeaker and headphone volume function is divided into a digital and an analog section. With Fast Mute, volume is reduced to mute position by digital volume only. Analog volume is not changed. This reduces any audible DC plops. To turn volume on again, the volume step that has been used before Fast Mute was activated must be transmitted. If the clipping mode is set to “**reduce volume**”, the following rule is used: To prevent severe clipping effects with bass, treble, or equalizer boosts, the internal volume is automatically limited to a level where, in combination with either bass, treble, or equalizer setting, the amplification does not exceed 12 dB. If the clipping mode is “**reduce tone control**”, the bass or treble value is reduced if amplification exceeds 12 dB. If the equalizer is switched on, the gain of those bands is reduced, where amplification together with volume exceeds 12 dB. If the clipping mode is “**compromise**”**,** the bass or treble value and volume are reduced half and half if amplification exceeds 12 dB. If the equalizer is switched on, the gain of those bands is reduced half and half, where amplification together with volume exceeds 12 dB. If the clipping mode is “**dynamic**”, volume is reduced automatically if the signal amplitudes would exceed –2 dBFS within the IC. **For operation of MDB, dynamic mode must be switched on.**	VOL_MAIN VOL_AUX

Table 3–11: Write registers on I²C subaddress 12_{hex}, continued

Register Address	Function	Name
00 29_{hex}	**Automatic Volume Correction (AVC) Loudspeaker Channel** bit[15:12] 00_{hex} AVC off (and reset internal variables) 08_{hex} AVC on bit[11:8] 08_{hex} 8 sec decay time 04_{hex} 4 sec decay time 02_{hex} 2 sec decay time 01_{hex} 20 ms decay time (should be used for approx. 100 ms after channel change) **Note:** AVC should not be used in any Dolby Prologic mode (with DPL 35xx), except in PANORAMA or 3D-PANORAMA mode, when only the loudspeaker output is active.	AVC
00 01_{hex} 00 30_{hex}	**Balance Loudspeaker Channel** **Balance Headphone Channel** bit[15:8] Linear Mode $7F_{hex}$ Left muted, Right 100% $7E_{hex}$ Left 0.8%, Right 100% ... 01_{hex} Left 99.2%, Right 100% 00_{hex} Left 100%, Right 100% FF_{hex} Left 100%, Right 99.2% ... 82_{hex} Left 100%, Right 0.8% 81_{hex} Left 100%, Right muted bit[15:8] Logarithmic Mode $7F_{hex}$ Left –127 dB, Right 0 dB $7E_{hex}$ Left –126 dB, Right 0 dB ... 01_{hex} Left –1 dB, Right 0 dB 00_{hex} Left 0 dB, Right 0 dB FF_{hex} Left 0 dB, Right –1 dB ... 81_{hex} Left 0 dB, Right –127 dB 80_{hex} Left 0 dB, Right –128 dB bit[7:0] Balance Mode 00_{hex} linear 01_{hex} logarithmic Positive balance settings reduce the left channel without affecting the right channel; negative settings reduce the right channel leaving the left channel unaffected.	BAL_MAIN BAL_AUX

Table 3–11: Write registers on I^2C subaddress 12_{hex}, continued

Register Address	Function	Name
00 20_{hex}	**Tone Control Mode Loudspeaker Channel** bit[15:8] 00_{hex} bass and treble is active FF_{hex} equalizer is active Defines whether Bass/Treble or Equalizer is activated for the loudspeaker channel. Bass and Equalizer cannot work simultaneously. If Equalizer is used, Bass, and Treble coefficients must be set to zero and vice versa.	TONE_MODE
00 02_{hex} 00 31_{hex}	**Bass Loudspeaker Channel** **Bass Headphone Channel** bit[15:8] extended range $7F_{hex}$ +20 dB 78_{hex} +18 dB 70_{hex} +16 dB 68_{hex} +14 dB normal range 60_{hex} +12 dB 58_{hex} +11 dB ... 08_{hex} +1 dB 00_{hex} 0 dB $F8_{hex}$ –1 dB ... $A8_{hex}$ –11 dB $A0_{hex}$ –12 dB Higher resolution is possible: an LSB step in the normal range results in a gain step of about 1/8 dB, in the extended range about 1/4 dB. With positive bass settings, internal clipping may occur even with overall volume less than 0 dB. This will lead to a clipped output signal. Therefore, it is not recommended to set bass to a value that, in conjunction with volume, would result in an overall positive gain.	BASS_MAIN BASS_AUX

Table 3–11: Write registers on I²C subaddress 12_{hex}, continued

Register Address	Function	Name
00 03_{hex} 00 32_{hex}	**Treble Loudspeaker Channel** **Treble Headphone Channel** bit[15:8] 78_{hex} +15 dB 70_{hex} +14 dB ... 08_{hex} +1 dB 00_{hex} 0 dB $F8_{hex}$ –1 dB ... $A8_{hex}$ –11 dB $A0_{hex}$ –12 dB Higher resolution is possible: an LSB step results in a gain step of about 1/8 dB. With positive treble settings, internal clipping may occur even with overall volume less than 0 dB. This will lead to a clipped output signal. Therefore, it is not recommended to set treble to a value that, in conjunction with volume, would result in an overall positive gain.	TREB_MAIN TREB_AUX
00 21_{hex} 00 22_{hex} 00 23_{hex} 00 24_{hex} 00 25_{hex}	**Equalizer Loudspeaker Channel Band 1 (below 120 Hz)** **Equalizer Loudspeaker Channel Band 2 (center: 500 Hz)** **Equalizer Loudspeaker Channel Band 3 (center: 1.5 kHz)** **Equalizer Loudspeaker Channel Band 4 (center: 5 kHz)** **Equalizer Loudspeaker Channel Band 5 (above: 10 kHz)** bit[15:8] 60_{hex} +12 dB 58_{hex} +11 dB ... 08_{hex} +1 dB 00_{hex} 0 dB $F8_{hex}$ –1 dB ... $A8_{hex}$ –11 dB $A0_{hex}$ –12 dB Higher resolution is possible: an LSB step results in a gain step of about 1/8 dB. Register Address	Function	Name
00 04_{hex} 00 33_{hex}	**Loudness Loudspeaker Channel** **Loudness Headphone Channel** bit[15:8] Loudness Gain 44_{hex} +17 dB 40_{hex} +16 dB ... 04_{hex} +1 dB 03_{hex} +0.75 dB 02_{hex} +0.5 dB 01_{hex} +0.25 dB 00_{hex} 0 dB bit[7:0] Loudness Mode 00_{hex} normal (constant volume at 1 kHz) 04_{hex} Super Bass (constant volume at 2 kHz) Higher resolution of Loudness Gain is possible: An LSB step results in a gain step of about 1/4 dB. Loudness increases the volume of low- and high-frequency signals, while keeping the amplitude of the reference frequency constant. The intended loudness has to be set according to the actual volume setting. Because loudness introduces gain, it is not recommended to set loudness to a value that, in conjunction with volume, would result in an overall positive gain. The corner frequency for bass amplification can be set to two different values. In Super Bass mode, the corner frequency is shifted up. The point of constant volume is shifted from 1 kHz to 2 kHz. Register Address	Function	Name
00 05_{hex}	**Spatial Effects Loudspeaker Channel** bit[15:8] Effect Strength $7F_{hex}$ Enlargement 100% $3F_{hex}$ Enlargement 50% ... 01_{hex} Enlargement 0.78% 00_{hex} Effect off FF_{hex} reduction 0.78% ... $C0_{hex}$ reduction 50% 80_{hex} reduction 100% bit[7:4] Spatial Effect Mode 0_{hex} Stereo Basewidth Enlargement (SBE) and Pseudo Stereo Effect (PSE). (Mode A) 2_{hex} Stereo Basewidth Enlargement (SBE) only. (Mode B) bit[3:0] Spatial Effect High-Pass Gain 0_{hex} max. high-pass gain 2_{hex} 2/3 high-pass gain 4_{hex} 1/3 high-pass gain 6_{hex} min. high-pass gain 8_{hex} automatic There are several spatial effect modes available: In mode A (low byte = 00_{hex}), the spatial effect depends on the source mode. If the incoming signal is mono, Pseudo Stereo Effect is active; for stereo signals, Pseudo Stereo Effect and Stereo Basewidth Enlargement is effective. The strength of the effect is controllable by the upper byte. A negative value reduces the stereo image. A strong spatial effect is recommended for small TV sets where loudspeaker spacing is rather close. For large screen TV sets, a more moderate spatial effect is recommended. In mode B, only Stereo Basewidth Enlargement is effective. For mono input signals, the Pseudo Stereo Effect has to be switched on. It is worth mentioning, that all spatial effects affect amplitude and phase response. With the lower 4 bits, the frequency response can be customized. A value of 0_{hex} yields a flat response for center signals (L = R), but a high-pass function for L or R only signals. A value of 6_{hex} has a flat response for L or R only signals, but a low-pass function for center signals. By using 8_{hex}, the frequency response is automatically adapted to the sound material by choosing an optimal high-pass gain.	SPAT_MAIN

Register Address	Function	Name
SCART SWITCHES AND DIGITAL I/O PINS		
00 13_{hex}	**ACB Register** Defines the level of the digital output pins and the position of the SCART switches bit[15] 0/1 low/high of digital output pin D_CTR_I/O_1 (MODUS[3]=0) bit[14] 0/1 low/high of digital output pin D_CTR_I/O_0 (MODUS[3]=0) bit[13:5] SCART DSP Input Select xxxx00xx0 SCART1 to DSP input (RESET position) xxxx01xx0 MONO to DSP input (Set Sound A Mono in the channel matrix mode for the corresponding output channels) xxxx10xx0 SCART2 to DSP input xxxx11xx0 SCART3 to DSP input xxxx00xx1 SCART4 to DSP input xxxx11xx1 mute DSP input bit[13:5] SCART1 Output Select xx00xxx0x SCART3 input to SCART1 output (RESET position) xx01xxx0x SCART2 input to SCART1 output xx10xxx0x MONO input to SCART1 output xx11xxx0x SCART1 DA to SCART1 output xx00xxx1x SCART2 DA to SCART1 output xx01xxx1x SCART1 input to SCART1 output xx10xxx1x SCART4 input to SCART1 output xx11xxx1x mute SCART1 output bit[13:5] SCART2 Output Select 00xxxx0xx SCART1 DA to SCART2 output (RESET position) 01xxxx0xx SCART1 input to SCART2 output 10xxxx0xx MONO input to SCART2 output 00xxxx1xx SCART2 DA to SCART2 output 01xxxx1xx SCART2 input to SCART2 output 10xxxx1xx SCART3 input to SCART2 output 11xxxx1xx SCART4 input to SCART2 output 11xxxx0xx mute SCART2 output bit[4:0] must be zero The RESET position becomes active at the time of the first write transmission on the control bus to the audio processing part. By writing to the ACB register first, the RESET state can be redefined.	ACB_REG
BEEPER		
00 14_{hex}	**Beeper Volume and Frequency** bit[15:8] Beeper Volume 00_{hex} off $7F_{hex}$ maximum volume bit[7:0] Beeper Frequency 01_{hex} 16 Hz (lowest) 40_{hex} 1 kHz FF_{hex} 4 kHz	BEEPER

3.3.2.7. Read Registers on I²C Subaddress 13_{hex}

Table 3–12: Read registers on I^2C subaddress 13_{hex}

Register Address	Function	Name
QUASI-PEAK DETECTOR READOUT		
00 19_{hex} 00 $1A_{hex}$	**Quasi-Peak Detector Readout Left** **Quasi-Peak Detector Readout Right** bit[15:0] 0_{hex}... $7FFF_{hex}$ values are 16 bit two's complement (only positive)	QPEAK_L QPEAK_R
MSP 44x0G VERSION READOUT REGISTERS		
00 $1E_{hex}$	**MSP Hardware Version Code** bit[15:8] 02_{hex} MSP 44x0G - B8 A change in the hardware version code defines hardware optimizations that may have influence on the chip's behavior. The readout of this register is identical to the hardware version code in the chip's imprint. **MSP Family Code** bit[7:4] 1_{hex} MSP 44x0G - B8 **MSP Major Revision Code** bit[3:0] 07_{hex} MSP 44x0G - B8	MSP_HARD MSP_FAMILY MSP_REVISION
00 $1F_{hex}$	**MSP Product Code** bit[15:8] $0A_{hex}$ MSP 4410G - B8 14_{hex} MSP 4420G - B8 28_{hex} MSP 4440G - B8 32_{hex} MSP 4450G - B8 By means of the MSP-Product Code, the control processor is able to decide which TV sound standards have to be considered. **MSP ROM Version Code** bit[7:0] 48_{hex} MSP 44x0G - B8 A change in the ROM version code defines internal software optimizations, that may have influence on the chip's behavior, e.g. new features may have been included. While a software change is intended to create no compatibility problems, customers that want to use the new functions can identify new MSP 44x0G versions according to this number. To avoid compatibility problems with MSP 3410B and MSP 34x0D, an offset of 40_{hex} is added to the ROM version code of the chip's imprint.	MSP_PRODUCT MSP_ROM

3.4. Programming Tips

This section describes the preferred method for initializing the MSP 44x0G. The initialization is grouped into four sections:

– SCART Signal Path (analog signal path)

– Demodulator

– SCART and I^2S Inputs

– Output Channels

See Fig. 2–1 on page 10 for a complete signal flow.

SCART Signal Path

1. Select analog input for the SCART baseband processing (SCART DSP Input Select) by means of the ACB register.
2. Select the source for each analog SCART output (SCART Output Select) by means of the ACB register.

Demodulator

For a complete setup of the TV sound processing from analog IF input to the source selection, the following steps must be performed:

1. Set MODUS register to the preferred mode and Sound IF input.
2. Choose preferred prescale (FM and NICAM) values.
3. Write STANDARD SELECT register.
4. If Automatic Sound Select is not active:
   Choose FM matrix repeatedly according to the sound mode indicated in the STATUS register.

SCART and I^2S Inputs

1. Select preferred prescale for SCART.
2. Select preferred prescale for I^2S inputs (set to 0 dB after RESET).

Output Channels

1. Select the source channel and matrix for each output channel.
2. Set audio baseband processing.
3. Select volume for each output channel.

3.5. Examples of Minimum Initialization Codes

Initialization of the MSP 44x0G according to these listings reproduces sound of the selected standard on the loudspeaker output. All numbers are hexadecimal. The examples have the following structure:

1. Perform an I^2C controlled reset of the IC.
2. Write MODUS register
   (with Automatic Sound Select).
3. Set Source Selection for loudspeaker channel
   (with matrix set to STEREO).
4. Set Prescale
   (FM and/or NICAM and dummy FM matrix).
5. Write STANDARD SELECT register.
6. Set Volume loudspeaker channel to 0 dB.

3.5.1. B/G-FM (A2 or NICAM)

```
<80  00  80 00>          // Softreset
<80  00  00 00>
<80  10  00 30  20 03>   // MODUS-Register: Automatic = on
<80  12  00 08  03 20>   // Source Sel. = (St or A) & Ch. Matr. = St
<80  12  00 0E  24 03>   // FM/AM-Prescale = 24hex,
                            FM-Matrix = MONO/SOUNDA
<80  12  00 10  5A 00>   // NICAM-Prescale = 5Ahex
<80  10  00 20  00 03>   // Standard Select: A2 B/G or NICAM B/G
          or
<80  10  00 20  00 08>
<80  12  00 00  73 00>   // Loudspeaker Volume 0 dB
```

3.5.2. BTSC-Stereo

```
<80  00  80 00>          // Softreset
<80  00  00 00>
<80  10  00 30  20 03>   // MODUS-Register: Automatic = on
<80  12  00 08  03 20>   // Source Sel. = (St or A) & Ch. Matr. = St
<80  12  00 0E  24 03>   // FM/AM-Prescale = 24hex,
                            FM-Matrix = Sound A Mono
<80  10  00 20  00 20>   // Standard Select: BTSC-STEREO
<80  12  00 00  73 00>   // Loudspeaker Volume 0 dB
```

3.5.3. BTSC-SAP with SAP at Loudspeaker Channel

```
<80  00  80 00>          // Softreset
<80  00  00 00>
<80  10  00 30  20 03>   // MODUS-Register: Automatic = on
<80  12  00 08  04 20>   // Source Sel. = (St or B) & Ch. Matr. = St
<80  12  00 0E  24 03>   // FM/AM-Prescale = 24hex,
                            FM-Matrix = Sound A Mono
<80  10  00 20  00 21>   // Standard Select: BTSC-SAP
<80  12  00 00  73 00>   // Loudspeaker Volume 0 dB
```

3.5.4. FM-Stereo Radio

<80 00 80 00> // Softreset

<80 00 00 00>

<80 10 00 30 20 03> // MODUS-Register: Automatic = on

<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St

<80 12 00 0E 24 03> // FM/AM-Prescale = 24_{hex}, FM-Matrix = Sound A Mono

<80 10 00 20 00 40> // Standard Select: FM-STEREO-RADIO

<80 12 00 00 73 00> // Loudspeaker Volume 0 dB

3.5.5. Automatic Standard Detection

A detailed software flow diagram is shown in Fig. 3–1 on page 46.

<80 00 80 00> // Softreset

<80 00 00 00>

<80 10 00 30 20 03> // MODUS-Register: Automatic = on

<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St

<80 12 00 0E 24 03> // FM/AM-Prescale = 24_{hex}, FM-Matrix = Sound A Mono

<80 12 00 10 5A 00> // NICAM-Prescale = $5A_{hex}$

<80 10 00 20 00 01> // Standard Select: Automatic Standard Detection

// Wait till STANDARD RESULT contains a value ≤ 07FF

// IF STANDARD RESULT contains 0000

// do some error handling

// ELSE

<80 12 00 00 73 00> // Loudspeaker Volume 0 dB

3.5.6. SCART1 Input to Loudspeaker in Stereo Sound

<80 00 80 00> *// reset*

<80 00 00 00>

<80 12 00 08 02 20> *// source loudspeaker = scart, stereo*

<80 12 00 0d 19 00> *// prescale scart*

<80 12 00 00 73 00> *// volume main = 0dB*

3.5.7. Software Flow for Interrupt driven STATUS Check

A detailed software flow diagram is shown in Fig. 3–1 on page 46.

If the D_CTR_I/O_1 pin of the MSP 44x0G is connected to an interrupt input pin of the controller, the following interrupt handler can be applied to be automatically called with each status change of the MSP 44x0G. The interrupt handler may adjust the TV display according to the new status information.

Interrupt Handler:

<80 11 02 00 <81 dd dd> // Read STATUS

// adjust TV display with given status information

// Return from Interrupt

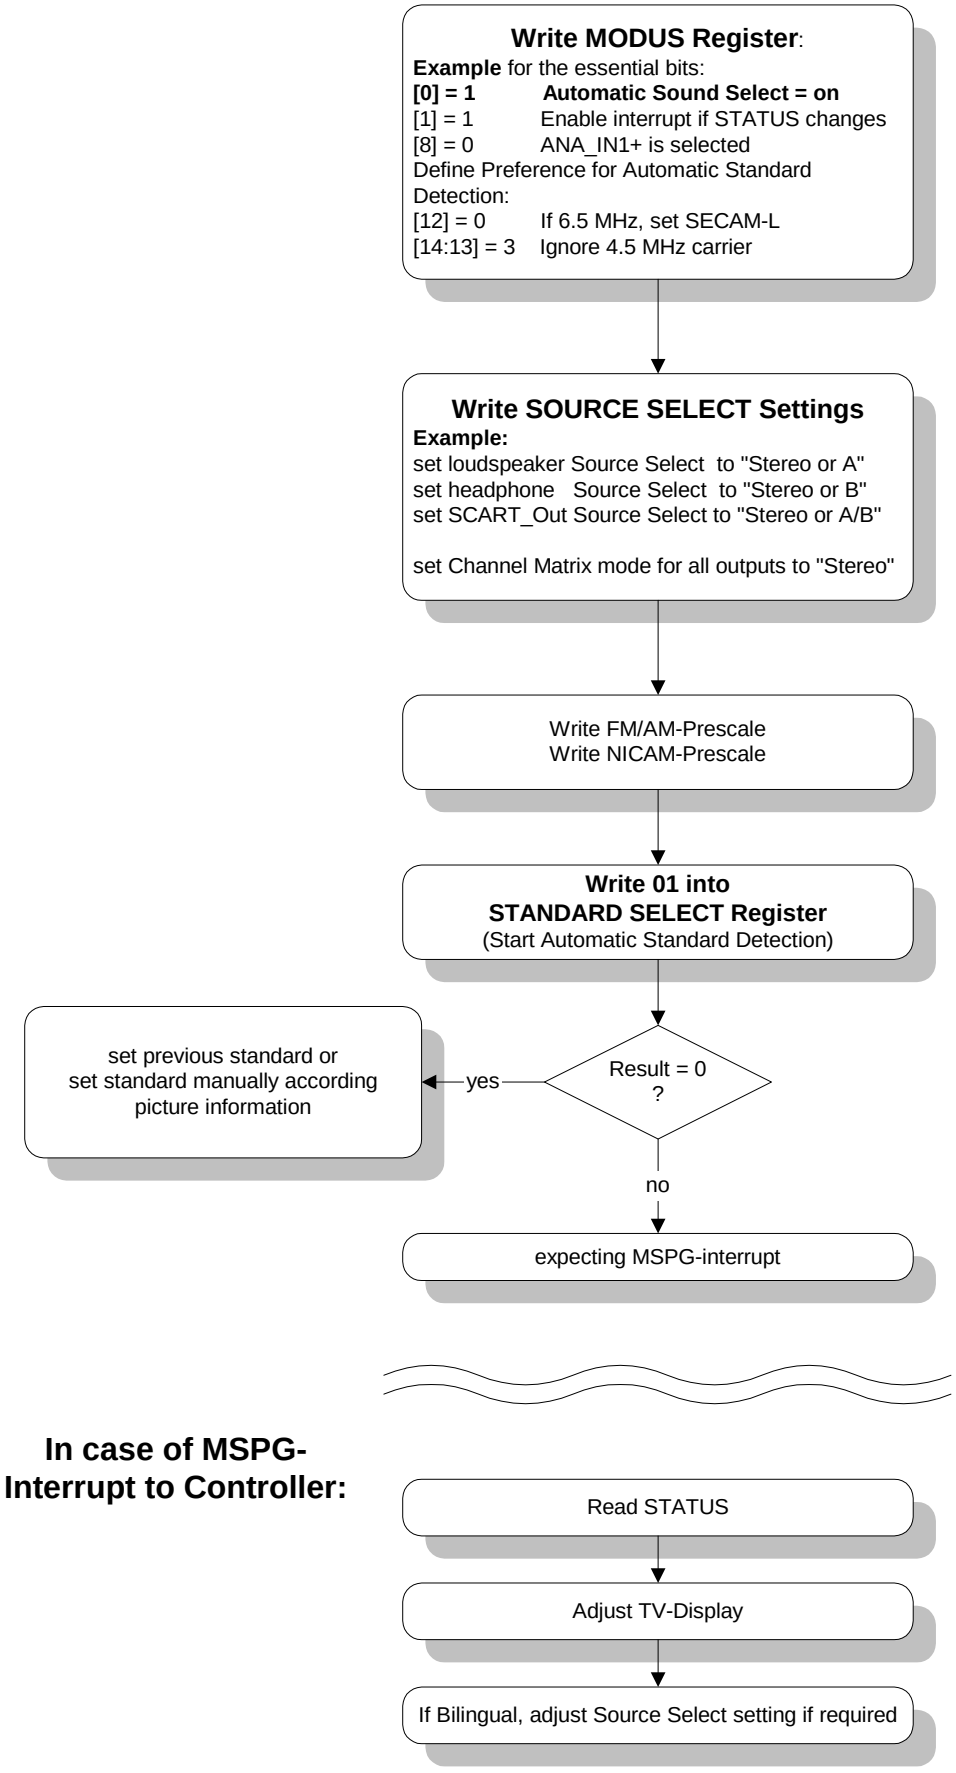

Fig. 3–1: Software flow diagram for a minimum demodulator setup for a European Multistandard TV set applying the Automatic Sound Select feature

4. Specifications

4.1. Outline Dimensions

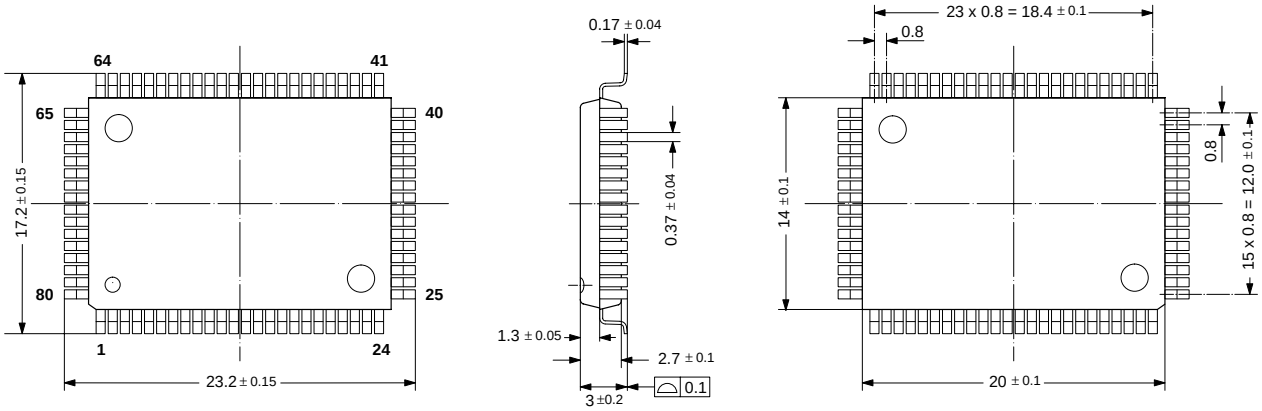

Fig. 4–1:
80-Pin Plastic Quad Flat Pack
(PQFP80)
Weight approximately 1.61 g
Dimensions in mm

4.3. Pin Descriptions

I2C_CL – I^2C Clock Input/Output (Fig. 4–14)
Via this pin, the I^2C-bus clock signal has to be supplied. The signal can be pulled down by the MSP in case of wait conditions.

I2C_DA – I^2C Data Input/Output (Fig. 4–14)
Via this pin, the I^2C-bus data is written to or read from the MSP.

I2S_CL – I^2S Clock Input/Output (Fig. 4–15)
Clock line for the I^2S bus. In master mode, this line is driven by the MSP; in slave mode, an external I^2S clock has to be supplied.

I2S_WS – I^2S Word Strobe Input/Output (Fig. 4–15)
Word strobe line for the I^2S bus. In master mode, this line is driven by the MSP; in slave mode, an external I^2S word strobe has to be supplied.

I2S_DA_OUT – I^2S Data Output (Fig. 4–19)
Output of digital serial sound data of the MSP on the I^2S bus.

I2S_DA_IN1 – I^2S Data Input 1 (Fig. 4–11)
First input of digital serial sound data to the MSP via the I^2S bus.

ADR_DA – ADR Bus Data Output (Fig. 4–19)
Output of digital serial data to the DRP 3510A via the ADR bus.

ADR_WS – ADR Bus Word Strobe Output (Fig. 4–19)
Word strobe output for the ADR bus.

ADR_CL – ADR Bus Clock Output (Fig. 4–19)
Clock line for the ADR bus.

DVSUP* – Digital Supply Voltage
Power supply for the digital circuitry of the MSP. Must be connected to a +5 V power supply.

DVSS* – Digital Ground
Ground connection for the digital circuitry of the MSP.

I2S_DA_IN2/3 – I^2S Data Input (Fig. 4–11)
This pin is connected to the second data input of the synchronous I^2S-bus interface (=I2S_DA_IN2) and in parallel to the data input of the multichannel I^2S-bus interface (=I2S_DA_IN3). With source select, the required input is chosen (not available for PQFP80 package).

I2S_DA_IN2 – I^2S Data Input 2 (Fig. 4–11)
Second input of digital serial sound data to the MSP via the I^2S bus.

I2S_CL3 – I^2S Clock Input/Output (Fig. 4–15)
Clock line for the asynchronous I^2S bus. Since only a slave mode is available an external I^2S clock has to be supplied.

I2S_WS3 – I^2S Word Strobe Input/Output (Fig. 4–15)
Word strobe line for the asynchronous I^2S bus. Since only a slave mode is available an external I^2S word strobe has to be supplied.

RESETQ – Reset Input (Fig. 4–7)
In the steady state, high level is required. A low level resets the MSP 44x0G.

I2S_DA_IN3 – I^2S Data Input 3 (Fig. 4–11)
Input of digital serial sound data to the MSP via the multichannel I^2S bus (only available for PQFP80 package).

DACA_R/L – Headphone Outputs (Fig. 4–17)
Output of the headphone signal. A 1-nF capacitor to AHVSS must be connected to these pins. The DC offset on these pins depends on the selected headphone volume.

VREF2 – Reference Ground 2
Reference analog ground. This pin must be connected separately to ground (AHVSS). VREF2 serves as a clean ground and should be used as the reference for analog connections to the loudspeaker and headphone outputs.

DACM_R/L – Loudspeaker Outputs (Fig. 4–17)
Output of the loudspeaker signal. A 1-nF capacitor to AHVSS must be connected to these pins. The DC offset on these pins depends on the selected loudspeaker volume.

DACM_SUB – Subwoofer Output (Fig. 4–17)
Output of the subwoofer signal. A 1-nF capacitor to AHVSS must be connected to this pin. Due to the low frequency content of the subwoofer output, the value of the capacitor may be increased for better suppression of high-frequency noise. The DC offset on this pin depends on the selected loudspeaker volume.

SC2_OUT_R/L – SCART2 Outputs (Fig. 4–18)
Output of the SCART2 signal. Connections to these pins must use a 100-Ω series resistor and are intended to be AC-coupled.

VREF1 – Reference Ground 1
Reference analog ground. This pin must be connected separately to ground (AHVSS). VREF1 serves as a clean ground and should be used as the reference for analog connections to the SCART outputs.

SC1_OUT_R/L – SCART1 Outputs (Fig. 4–18)
Output of the SCART1 signal. Connections to these pins must use a 100-Ω series resistor and are intended to be AC-coupled.

CAPL_A – Volume Capacitor Headphone (Fig. 4–20)
A 10-µF capacitor to AHVSUP must be connected to this pin. It serves as a smoothing filter for headphone volume changes in order to suppress audible plops. The value of the capacitor can be lowered to 1-µF if faster response is required. The area encircled by the trace lines should be minimized; keep traces as short as possible. This input is sensitive for magnetic induction.

AHVSUP* – Analog Power Supply High Voltage
Power is supplied via this pin for the analog circuitry of the MSP (except IF input). This pin must be connected to the +8 V supply.

CAPL_M – Volume Capacitor Loudspeaker (Fig. 4–20)
A 10-µF capacitor to AHVSUP must be connected to this pin. It serves as a smoothing filter for loudspeaker volume changes in order to suppress audible plops. The value of the capacitor can be lowered to 1 µF if faster response is required. The area encircled by the trace lines should be minimized; keep traces as short as possible. This input is sensitive for magnetic induction.

AHVSS* – Ground for Analog Power Supply
High Voltage
Ground connection for the analog circuitry of the MSP (except IF input).

AGNDC – Internal Analog Reference Voltage
This pin serves as the internal ground connection for the analog circuitry (except IF input). It must be connected to the VREF pins with a 3.3-µF and a 100-nF capacitor in parallel. This pins shows a DC level of typically 3.73 V.

SC4_IN_L/R – SCART4 Inputs (Fig. 4–10)
The analog input signal for SCART4 is fed to this pin. Analog input connection must be AC-coupled.

ASG – Analog Shield Ground
Analog ground (AHVSS) should be connected to this pin to reduce cross-coupling between SCART inputs.

SC3_IN_L/R – SCART3 Inputs (Fig. 4–10)
The analog input signal for SCART3 is fed to this pin. Analog input connection must be AC-coupled.

ASG – Analog Shield Ground
Analog ground (AHVSS) should be connected to this pin to reduce cross-coupling between SCART inputs.

SC2_IN_L/R – SCART2 Inputs (Fig. 4–10)
The analog input signal for SCART2 is fed to this pin. Analog input connection must be AC-coupled.

ASG – Analog Shield Ground
Analog ground (AHVSS) should be connected to this pin to reduce cross-coupling between SCART inputs.

SC1_IN_L/R – SCART1 Inputs (Fig. 4–10)
The analog input signal for SCART1 is fed to this pin. Analog input connection must be AC-coupled.

VREFTOP – Reference Voltage IF A/D Converter (Fig. 4–12)
Via this pin, the reference voltage for the IF A/D converter is decoupled. It must be connected to AVSS pins with a 10-µF and a 100-nF capacitor in parallel. Traces must be kept short.

MONO_IN – Mono Input (Fig. 4–10)
The analog mono input signal is fed to this pin. Analog input connection must be AC-coupled.

AVSS* – Ground for Analog Power Supply Voltage
Ground connection for the analog IF input circuitry of the MSP.

AVSUP* – Analog Power Supply Voltage
Power is supplied via this pin for the analog IF input circuitry of the MSP. This pin must be connected to the +5 V supply.

ANA_IN1+ – IF Input 1 (Fig. 4–12)
The analog sound IF signal is supplied to this pin. Inputs must be AC-coupled. This pin is designed as symmetrical input: ANA_IN1+ is internally connected to one input of a symmetrical op amp, ANA_IN- to the other.

ANA_IN– – IF Common (Fig. 4–12)
This pins serves as a common reference for ANA_IN1/2+ inputs.

ANA_IN2+ – IF Input 2 (Fig. 4–12)
The analog sound if signal is supplied to this pin. Inputs must be AC-coupled. This pin is designed as symmetrical input: ANA_IN2+ is internally connected to one input of a symmetrical op amp, ANA_IN– to the other.

TESTEN – Test Enable Pin (Fig. 4–8)
This pin enables factory test modes. For normal operation, it must be connected to ground.

XTAL_IN, XTAL_OUT – Crystal Input and Output Pins (Fig. 4–16)
These pins are connected to an 18.432 MHz crystal oscillator which is digitally tuned by integrated shunt capacitances. An external clock can be fed into XTAL_IN. The audio clock output signal AUD_CL_OUT is derived from the oscillator. External capacitors at each crystal pin to ground (AVSS) are required. It should be verified by layout, that no supply current for the digital circuitry is flowing through the ground connection point.

TP – This pin enables factory test modes. For normal operation, it must be left vacant.

AUD_CL_OUT – Audio Clock Output (Fig. 4–16)
This is the 18.432 MHz main clock output.

D_CTR_I/O_1/0 – Digital Control Input/Output Pins (Fig. 4–15)
General purpose input/output pins. Pin D_CTR_I/O_1 can be used as an interrupt request pin to the controller.

ADR_SEL – I^2C Bus Address Select (Fig. 4–13)
By means of this pin, one of three device addresses for the MSP can be selected. The pin can be connected to ground (I^2C device addresses $80/81_{hex}$), to +5 V supply ($84/85_{hex}$), or left open ($88/89_{hex}$).

STANDBYQ – Stand-by
In normal operation, this pin must be high. If the MSP 44x0G is switched off by first pulling STANDBYQ low and then (after >1µs delay) switching off DVSUP and AVSUP, but keeping AHVSUP (**'Standby'-mode**), the SCART switches maintain their position and function.

*** Application Note:**
All ground pins should be connected to one low-resistive ground plane. All supply pins should be connected separately with short and low-resistive lines to the power supply. Decoupling capacitors from DVSUP to DVSS, AVSUP to AVSS, and AHVSUP to AHVSS are recommended as closely as possible to these pins. Decoupling of DVSUP and DVSS is most important. We recommend using more than one capacitor. By choosing different values, the frequency range of active decoupling can be extended. In our application boards we use: 220 pF, 470 pF, 1.5 nF, and 10 µF. The capacitor with the lowest value should be placed nearest to the DVSUP and DVSS pins.

The ASG pins should be connected as closely as possible to the MSP ground. If they are lead with the SCART-inputs as shielding lines, they should not be connected to ground at the SCART connector.

4.6. Electrical Characteristics

4.6.1. Absolute Maximum Ratings

Symbol	Parameter	Pin Name	Min.	Max.	Unit
T_A	Ambient Operating Temperature	–	0	70	°C
T_S	Storage Temperature	–	–40	125	°C
V_{SUP1}	First Supply Voltage	AHVSUP	–0.3	9.0	V
V_{SUP2}	Second Supply Voltage	DVSUP	–0.3	6.0	V
V_{SUP3}	Third Supply Voltage	AVSUP	–0.3	6.0	V
dV_{SUP23}	Voltage between AVSUP and DVSUP	AVSUP, DVSUP	–0.5	0.5	V
P_{TOT}	Power Dissipation PSDIP64 PQFP80 PLQFP64	AHVSUP, DVSUP, AVSUP		 1300 1000 960	 mW mW mW
V_{Idig}	Input Voltage, all Digital Inputs		–0.3	V_{SUP2}+0.3	V
I_{Idig}	Input Current, all Digital Pins	–	–20	+20	mA[1]
V_{Iana}	Input Voltage, all Analog Inputs	SCn_IN_s,[2] MONO_IN	–0.3	V_{SUP1}+0.3	V
I_{Iana}	Input Current, all Analog Inputs	SCn_IN_s,[2] MONO_IN	–5	+5	mA[1]
I_{Oana}	Output Current, all SCART Outputs	SCn_OUT_s[2]	[3], [4]	[3], [4]	
I_{Oana}	Output Current, all Analog Outputs except SCART Outputs	DACp_s[2]	[3]	[3]	
I_{Cana}	Output Current, other pins connected to capacitors	CAPL_p,[2] AGNDC	[3]	[3]	

[1] positive value means current flowing into the circuit
[2] “n” means “1”, “2”, “3”, or “4”, “s” means “L” or “R”, “p” means “M” or “A”
[3] The analog outputs are short-circuit proof with respect to First Supply Voltage and ground.
[4] Total chip power dissipation must not exceed absolute maximum rating.

Stresses beyond those listed in the “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only. Functional operation of the device at these or any other conditions beyond those indicated in the “Recommended Operating Conditions/Characteristics” of this specification is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.

4.6.2. Recommended Operating Conditions (T_A = 0 to 70 °C)

4.6.2.1. General Recommended Operating Conditions

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit
V_{SUP1}	First Supply Voltage (AHVSUP = 8 V)	AHVSUP	7.6	8.0	8.7	V
	First Supply Voltage (AHVSUP = 5 V)		4.75	5.0	5.25	V
V_{SUP2}	Second Supply Voltage	DVSUP	4.75	5.0	5.25	V
V_{SUP3}	Third Supply Voltage	AVSUP	4.75	5.0	5.25	V
t_{STBYQ1}	STANDBYQ Setup Time before Turn-off of Second Supply Voltage	STANDBYQ, DVSUP	1			µs

4.6.2.2. Analog Input and Output Recommendations

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit
C_{AGNDC}	AGNDC-Filter-Capacitor	AGNDC	–20%	3.3		µF
	Ceramic Capacitor in Parallel		–20%	100		nF
C_{inSC}	DC-Decoupling Capacitor in front of SCART Inputs	SCn_IN_s[1)]	–20%	330		nF
V_{inSC}	SCART Input Level				2.0	V_{RMS}
V_{inMONO}	Input Level, Mono Input	MONO_IN			2.0	V_{RMS}
R_{LSC}	SCART Load Resistance	SCn_OUT_s[1)]	10			kΩ
C_{LSC}	SCART Load Capacitance				6.0	nF
C_{VMA}	Main/AUX Volume Capacitor	CAPL_p[1)]		10		µF
C_{FMA}	Main/AUX Filter Capacitor	DACp_s[1)]	–10%	1	+10%	nF

[1)] “n” means “1”, “2”, “3", or “4", “s” means “L” or “R”, “p” means “M” or “A”

4.6.2.3. Recommendations for Analog Sound IF Input Signal

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit
$C_{VREFTOP}$	VREFTOP-Filter-Capacitor	VREFTOP	–20%	10		µF
	Ceramic Capacitor in Parallel		–20%	100		nF
F_{IF_FMTV}	Analog Input Frequency Range for TV Applications	ANA_IN1+, ANA_IN2+, ANA_IN–	0		9	MHz
$F_{IF\_FMRADIO}$	Analog Input Frequency for FM-Radio Applications			10.7		MHz
V_{IF_FM}	Analog Input Range FM/NICAM		0.1	0.8	3	V_{pp}
V_{IF_AM}	Analog Input Range AM/NICAM		0.1	0.45	0.8	V_{pp}
R_{FMNI}	Ratio: NICAM Carrier/FM Carrier (unmodulated carriers) BG: I:		 –20 –23	 –7 –10	 0 0	 dB dB
R_{AMNI}	Ratio: NICAM Carrier/AM Carrier (unmodulated carriers)		–25	–11	0	dB
R_{FM}	Ratio: FM-Main/FM-Sub Satellite			7		dB
$R_{FM1/FM2}$	Ratio: FM1/FM2 German FM-System			7		dB
R_{FC}	Ratio: Main FM Carrier/ Color Carrier		15	–	–	dB
R_{FV}	Ratio: Main FM Carrier/ Luma Components		15	–	–	dB
PR_{IF}	Passband Ripple		–	–	±2	dB
SUP_{HF}	Suppression of Spectrum above 9.0 MHz (not for FM Radio)		15		–	dB
FM_{MAX}	Maximum FM-Deviation (approx.) normal mode HDEV2: high deviation mode HDEV3: very high deviation mode				 ±180 ±360 ±540	 kHz kHz kHz

4.6.2.4. Crystal Recommendations

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit
General Crystal Recommendations						
f_P	Crystal Parallel Resonance Frequency at 12 pF Load Capacitance			18.432		MHz
R_R	Crystal Series Resistance			8	25	Ω
C_0	Crystal Shunt (Parallel) Capacitance			6.2	7.0	pF
C_L	External Load Capacitance[1)]	XTAL_IN, XTAL_OUT	PSDIP P(L)QFP	approx. 1.5 approx. 3.3		pF pF
Crystal Recommendations for Master-Slave Applications (MSP-clock must perform synchronization to I^2S clock)						
f_{TOL}	Accuracy of Adjustment		–20		+20	ppm
D_{TEM}	Frequency Variation versus Temperature		–20		+20	ppm
C_1	Motional (Dynamic) Capacitance		19	24		fF
f_{CL}	Required Open Loop Clock Frequency (T_{amb} = 25 °C)	AUD_CL_OUT	18.431		18.433	MHz
Crystal Recommendations for FM/NICAM Applications (No MSP-clock synchronization to I^2S clock possible)						
f_{TOL}	Accuracy of Adjustment		–30		+30	ppm
D_{TEM}	Frequency Variation versus Temperature		–30		+30	ppm
C_1	Motional (Dynamic) Capacitance		15			fF
f_{CL}	Required Open Loop Clock Frequency (T_{amb} = 25 °C)	AUD_CL_OUT	18.4305		18.4335	MHz
Crystal Recommendations for all analog FM/AM Applications (No MSP-clock synchron. to I^2S/NICAM clock possible)						
f_{TOL}	Accuracy of Adjustment		–100		+100	ppm
D_{TEM}	Frequency Variation versus Temperature		–50		+50	ppm
f_{CL}	Required Open Loop Clock Frequency (T_{amb} = 25 °C)	AUD_CL_OUT	18.429		18.435	MHz
Amplitude Recommendation for Operation with External Clock Input (C_{load} after reset typ. 22 pF)						
V_{XCA}	External Clock Amplitude	XTAL_IN	0.7			V_{pp}

[1)] External capacitors at each crystal pin to ground are required. They are necessary to tune the open-loop frequency of the internal PLL and to stabilize the frequency in closed-loop operation.
Due to different layouts, the accurate capacitor value should be determined with the customer PCB. The suggested values (1.5...3.3 pF) are figures based on experience and should serve as “start value”.

To adjust the capacitor value, reset the MSP. After the reset no I^2C telegrams should be transmitted. Measure the frequency at AUD_CL_OUT-pin. Change the capacitor value until the free running frequency matches 18.432 MHz as closely as possible. The higher the capacity, the lower the resulting clock frequency.

Note: To minimize adjustment tolerances for all MSP-generations, it is strongly recommended to use the so-called MSP-XTAL-REF ICs (available in all packages) for the capacitor adjustment.

4.6.3. Characteristics

at T_A = 0 to 70 °C, f_{CLOCK} = 18.432 MHz, V_{SUP1} = 7.6 to 8.7 V, V_{SUP2} = 4.75 to 5.25 V for min./max. values
at T_A = 60 °C, f_{CLOCK} = 18.432 MHz, V_{SUP1} = 8 V, V_{SUP2} = 5 V for typical values,
T_J = Junction Temperature
MAIN (M) = Loudspeaker Channel, AUX (A) = Headphone Channel

4.6.3.1. General Characteristics

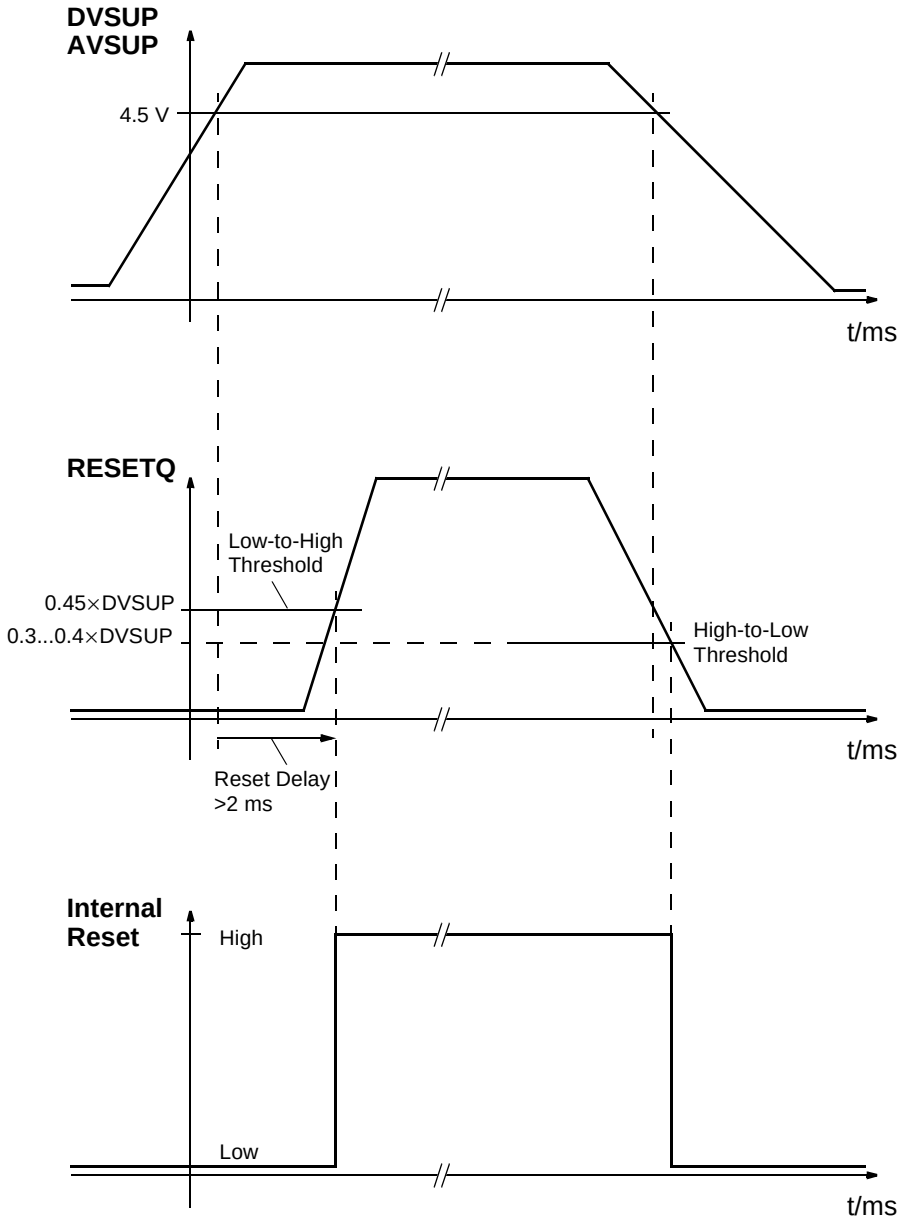
Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
Supply							
I_{SUP1A}	First Supply Current (active) (AHVSUP = 8 V)	AHVSUP		17 11	25 16	mA mA	Vol. Main and Aux = 0 dB Vol. Main and Aux = -30dB
	First Supply Current (active) (AHVSUP = 5 V)			11 8	17 11	mA mA	Vol. Main and Aux = 0 dB Vol. Main and Aux = -30 dB
I_{SUP2A}	Second Supply Current (active)	DVSUP		65	80	mA	
I_{SUP3A}	Third Supply Current (active)	AVSUP		30	38	mA	
I_{SUP1S}	First Supply Current (AHVSUP = 8 V)	AHVSUP		5.6	7.7	mA	STANDBYQ = low
	First Supply Current (AHVSUP = 5 V)			3.7	5.1	mA	
Clock							
f_{CLOCK}	Clock Input Frequency	XTAL_IN		18.432		MHz	
D_{CLOCK}	Clock High to Low Ratio		45		55	%	
t_{JITTER}	Clock Jitter (Verification not provided in Production Test)				50	ps	
V_{xtalDC}	DC-Voltage Oscillator			2.5		V	
$t_{Startup}$	Oscillator Startup Time at VDD Slew-rate of 1 V/1 µs	XTAL_IN, XTAL_OUT		0.4	2	ms	
V_{ACLKAC}	Audio Clock Output AC Voltage	AUD_CL_OUT	1.2	1.8		V_{pp}	load = 40 pF
V_{ACLKDC}	Audio Clock Output DC Voltage		0.4		0.6	V_{SUP3}	I_{max} = 0.2 mA
r_{outHF_ACL}	HF Output Resistance			140		Ω	

4.6.3.2. Digital Inputs, Digital Outputs

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
Digital Input Levels							
V_{DIGIL}	Digital Input Low Voltage	STANDBYQ D_CTR_I/O_0/1			0.2	V_{SUP2}	
V_{DIGIH}	Digital Input High Voltage		0.5			V_{SUP2}	
Z_{DIGI}	Input Impedance				5	pF	
I_{DLEAK}	Digital Input Leakage Current		–1		1	µA	0 V < U_{INPUT}< DVSUP D_CTR_I/O_0/1: tri-state
V_{DIGIL}	Digital Input Low Voltage	ADR_SEL			0.2	V_{SUP2}	
V_{DIGIH}	Digital Input High Voltage		0.8			V_{SUP2}	
I_{ADRSEL}	Input Current Address Select Pin		–500	–220		µA	U_{ADR_SEL}= DVSS
				220	500	µA	U_{ADR_SEL}= DVSUP
Digital Output Levels							
V_{DCTROL}	Digital Output Low Voltage	D_CTR_I/O_0 D_CTR_I/O_1			0.4	V	IDDCTR = 1 mA
V_{DCTROH}	Digital Output High Voltage		V_{SUP2} –0.3			V	IDDCTR = –1 mA

4.6.3.3. Reset Input and Power-Up

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
RESETQ Input Levels							
V_{RHL}	Reset High-Low Transition Voltage	RESETQ	0.3		0.4	V_{SUP2}	
V_{RLH}	Reset Low-High Transition Voltage		0.45		0.55	V_{SUP2}	
Z_{RES}	Input Capacitance				5	pF	
I_{RES}	Input High Current				20	µA	U_{RESETQ} = DVSUP



Note: The reset should not reach high level before the oscillator has started. This requires a reset delay of >2 ms

0.45 x DVSUP means 2.25 Volt with DVSUP = 5.0 V

Fig. 4–22: Power-up sequence

4.6.3.4. I²C-Bus Characteristics

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
V_{I2CIL}	I²C-Bus Input Low Voltage	I2C_CL, I2C_DA			0.3	V_{SUP2}	
V_{I2CIH}	I²C-Bus Input High Voltage		0.6			V_{SUP2}

5. Appendix A: Overview of TV-Sound Standards

5.1. NICAM 728

Table 5–1: Summary of NICAM 728 sound modulation parameters

Specification	I	B/G	L		D/K	
Carrier frequency of digital sound	6.552 MHz	5.85 MHz	5.85 MHz		5.85 MHz	
Transmission rate	728 kbit/s					
Type of modulation	Differentially encoded quadrature phase shift keying (DQPSK)					
Spectrum shaping Roll-off factor	by means of Roll-off filters					
	1.0	0.4	0.4		0.4	
Carrier frequency of analog sound component	6.0 MHz FM mono	5.5 MHz FM mono	6.5 MHz AM mono		6.5 MHz FM mono	
			terrestrial	cable		
Power ratio between vision carrier and analog sound carrier	10 dB	13 dB	10 dB	16 dB	13 dB	
Power ratio between analog and modulated digital sound carrier	10 dB	7 dB	17 dB	11 dB	China/ Hungary	Poland
					12 dB	7 dB

Table 5–2: Summary of NICAM 728 sound coding characteristics

Characteristics	Values
Audio sampling frequency	32 kHz
Number of channels	2
Initial resolution	14 bit/sample
Companding characteristics	near instantaneous, with compression to 10 bits/sample in 32-samples (1 ms) blocks
Coding for compressed samples	2’s complement
Preemphasis	CCITT Recommendation J.17 (6.5 dB attenuation at 800 Hz)
Audio overload level	+12 dBm measured at the unity gain frequency of the preemphasis network (2 kHz)

5.2. A2-Systems

Table 5–3: Key parameters for A2 Systems of Standards B/G, D/K, and M

Characteristics	**Sound Carrier FM1**			**Sound Carrier FM2**		
TV-Sound Standard	**B/G**	**D/K**	**M**	**B/G**	**D/K**	**M**
Carrier frequency in MHz	5.5	6.5	4.5	5.7421875	6.2578125 6.7421875 5.7421875	4.724212
Vision/sound power difference	13 dB			20 dB		
Sound bandwidth	40 Hz to 15 kHz					
Preemphasis	50 µs		75 µs	50 µs		75 µs
Frequency deviation (nom/max)	±27/±50 kHz		±17/±25 kHz	±27/±50 kHz		±15/±25 kHz
Transmission Modes						
Mono transmission	mono			mono		
Stereo transmission	(L+R)/2		(L+R)/2	R		(L–R)/2
Dual sound transmission	language A			language B		
Identification of Transmission Mode						
Pilot carrier frequency				54.6875 kHz		55.0699 kHz
Max. deviation portion				±2.5 kHz		
Type of modulation / modulation depth				AM / 50%		
Modulation frequency				mono: unmodulated stereo: 117.5 Hz dual: 274.1 Hz		 149.9 Hz 276.0 Hz

5.3. BTSC-Sound System

Table 5–4: Key parameters for BTSC-Sound Systems

	Aural Carrier	BTSC-MPX-Components				
		(L+R)	Pilot	(L–R)	SAP	Prof. Ch.
Carrier frequency (f_{hNTSC} = 15.734 kHz) (f_{hPAL} = 15.625 kHz)	4.5 MHz	Baseband	f_h	2 f_h	5 f_h	6.5 f_h
Sound bandwidth in kHz		0.05 - 15		0.05 - 15	0.05 - 12	0.05 - 3.4
Preemphasis		75 µs		DBX	DBX	150 µs
Max. deviation to Aural Carrier	73 kHz (total)	25 kHz[1)]	5 kHz	50 kHz[1)]	15 kHz	3 kHz
Max. Freq. Deviation of Subcarrier Modulation Type				AM	10 kHz FM	3 kHz FM
[1)] Sum does not exceed 50 kHz due to interleaving effects						

5.4. Japanese FM Stereo System (EIA-J)

Table 5–5: Key parameters for Japanese FM-Stereo Sound System EIA-J

	Aural Carrier FM	EIA-J-MPX-Components		
		(L+R)	(L–R)	Identification
Carrier frequency (f_h = 15.734 kHz)	4.5 MHz	Baseband	2 f_h	3.5 f_h
Sound bandwidth		0.05 - 15 kHz	0.05 - 15 kHz	–
Preemphasis		75 µs	75 µs	none
Max. deviation portion to Aural Carrier	47 kHz	25 kHz	20 kHz	2 kHz
Max. Freq. Deviation of Subcarrier Modulation Type			10 kHz FM	60% AM
Transmitter-sided delay		20 µs	0 µs	0 µs
Mono transmission		L+R	–	unmodulated
Stereo transmission		L+R	L–R	982.5 Hz
Bilingual transmission		Language A	Language B	922.5 Hz

5.5. FM Satellite Sound

Table 5–6: Key parameters for FM Satellite Sound

Carrier Frequency	Maximum FM Deviation	Sound Mode	Bandwidth	Deemphasis
6.5 MHz	85 kHz	Mono	15 kHz	50 µs
7.02/7.20 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive
7.38/7.56 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive
7.74/7.92 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive

5.6. FM-Stereo Radio

Table 5–7: Key parameters for FM-Stereo Radio Systems

	Aural Carrier	FM-Radio-MPX-Components			
		(L+R)	Pilot	(L–R)	RDS/ARI
Carrier frequency (f_p = 19 kHz)	10.7 MHz	Baseband	f_p	2 f_p	3 f_h
Sound bandwidth in kHz		0.05 - 15		0.05 - 15	
Preemphasis: – USA – Europe		 75 µs 50 µs		 75 µs 50 µs	
Max. deviation to Aural Carrier	75 kHz (100%)	90%	10%	90%	5%

6. Appendix B: Manual/Compatibility Mode

To adapt the modes of the STANDARD SELECT register to individual requirements and for reasons of **compatibility to the MSP 34x0D,** the MSP 44x0G offers an Manual/Compatibility Mode, which provides sophisticated programming of the MSP 44x0G.

Using the STANDARD SELECT register generally provides a more economic way to program the MSP 44x0G and will result in optimal behavior. **Therefore, it is not recommend to use the Manual/Compatibility mode.** In those cases, where the MSP 34x0D is to be substituted by the MSP 44x0G, the tips given in Section 7.3. on page 98 have to be obeyed by the controller software.

6.1. Demodulator Write and Read Registers for Manual/Compatibility Mode

Table 6–1: Demodulator Write Registers; Subaddress: 10_{hex}; these registers are not readable!

Demodulator Write Registers	Address (hex)	MSP-Version	Description	Reset Mode	Page
AUTO_FM/AM	00 21	3410, 3450	**1. MODUS[0]=1 (Automatic Sound Select):** Switching Level threshold of Automatic Switching between NICAM and FM/AM in case of bad NICAM reception **2. MODUS[0]=0 (Manual Mode):** Activation and configuration of Automatic Switching between NICAM and FM/AM in case of bad NICAM reception	00 00	84
A2_Threshold	00 22	all	A2 Stereo Identification Threshold	00 19_{hex}	86
CM_Threshold	00 24	all	Carrier-Mute Threshold	00 $2A_{hex}$	86
AD_CV	00 BB	all	SIF-input selection, configuration of AGC, and Carrier-Mute Function	00 00	87
MODE_REG	00 83	3410, 3450	Controlling of MSP-Demodulator and Interface options. As soon as this register is applied, the MSP 44x0G works in the **MSP 34x0D compatibility mode.** **Warning: In this mode, BTSC, EIA-J, and FM-Radio are disabled.** Only MSP 34x0D features are available; the use of MODUS and STATUS register is not allowed. The MSP 44x0G is reset to the normal mode by first programming the MODUS register followed by transmitting a valid standard code to the STANDARD SELECTION register.	00 00	88
FIR1 FIR2	00 01 00 05		FIR1-filter coefficients channel 1 (6 · 8 bit) FIR2-filter coefficients channel 2 (6 · 8 bit), + 3 · 8 bit offset (total 72 bit)	00 00	90
DCO1_LO DCO1_HI DCO2_LO DCO2_HI	00 93 00 9B 00 A3 00 AB		Increment channel 1 Low Part Increment channel 1 High Part Increment channel 2 Low Part Increment channel 2 High Part	00 00	90
PLL_CAPS	00 1F		Not of interest for the customer Switchable PLL capacitors to tune open-loop frequency	00 56	93
Note: All registers except AUTO_FM/AM, A2_Threshold, and CM_Threshold are initialized during STANDARD SELECTION and are automatically updated when Automatic Sound Select (MODUS[0]=1) is on.					

Table 6–2: Demodulator Read Registers; Subaddress: 11_{hex}; these registers are not writable!

Demodulator Read Registers	Address (hex)	MSP-Version	Description	Page
C_AD_BITS	00 23	3410, 3450	NICAM-Sync bit, NICAM-C-Bits, and three LSBs of additional data bits	92
ADD_BITS	00 38		NICAM: bit [10:3] of additional data bits	92
CIB_BITS	00 3E		NICAM: CIB1 and CIB2 control bits	92
ERROR_RATE	00 57		NICAM error rate, updated with 182 ms	93
PLL_CAPS	02 1F		Not for customer use	93
AGC_GAIN	02 1E		Not for customer use	93

6.2. DSP Write and Read Registers for Manual/Compatibility Mode

Table 6–3: DSP-Write Registers; Subaddress: 12_{hex}, all registers are readable as well

Write Register	Address (hex)	Bits	Operational Modes and Adjustable Range	Reset Mode	Page
Volume SCART1 channel: Ctrl. mode	00 07	[7:0]	[Linear mode / logarithmic mode]	00_{hex}	94
FM Fixed Deemphasis	00 0F	[15:8]	[50 µs, 75 µs, J17, OFF]	50 µs	94
FM Adaptive Deemphasis		[7:0]	[OFF, WP1]	OFF	94
Identification Mode	00 15	[7:0]	[B/G, M]	B/G	95
FM DC Notch	00 17	[7:0]	[ON, OFF]	ON	95
Volume SCART2 channel: Ctrl. mode	00 40	[7:0]	[Linear mode / logarithmic mode]	00_{hex}	94

Table 6–4: DSP Read Registers; Subaddress: 13_{hex}, all registers are not writable

Additional Read Registers	Address (hex)	Bits	Output Range		Page
Stereo detection register for A2 Stereo Systems	00 18	[15:8]	[80_{hex} ... $7F_{hex}$]	8 bit two's complement	95
DC level readout FM1/Ch2-L	00 1B	[15:0]	[8000_{hex} ... $7FFF_{hex}$]	16 bit two's complement	95
DC level readout FM2/Ch1-R	00 1C	[15:0]	[8000_{hex} ... $7FFF_{hex}$]	16 bit two's complement	95

6.3. Manual/Compatibility Mode: Description of Demodulator Write Registers

6.3.1. Automatic Switching between NICAM and Analog Sound

In case of bad NICAM reception or loss of the NICAM-carrier, the MSP 44x0G offers an Automatic Switching (fall back) to the analog sound (FM/AM-mono), without the necessity for the controller of reading and evaluating any parameters. If a proper NICAM signal returns, switching back to this source is performed automatically as well. The feature evaluates the NICAM ERROR_RATE and switches, if necessary, all output channels which are assigned to the NICAM-source, to the analog source, and vice versa.

An appropriate hysteresis algorithm avoids oscillating effects (see Fig. 6–1). STATUS[9] and C_AD_BITS[11] (Address: 0023_{hex}) provide information about the actual NICAM-FM/AM-status.

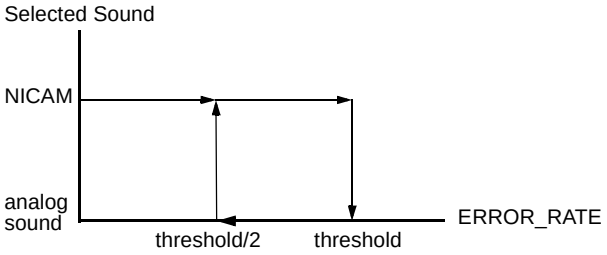

Fig. 6–1: Hysteresis for Automatic Switching

6.3.1.1. Function in Automatic Sound Select Mode

The Automatic Sound Select feature (MODUS[0]=1) includes the procedure mentioned above. By default, the internal ERROR_RATE threshold is set to 700_{dec}. i.e.:

– NICAM → analog Sound if ERROR_RATE > 700

– analog Sound → NICAM if ERROR_RATE < 700/2

The ERROR_RATE value of 700 corresponds to a BER of approximately $5.46*10^{-3}$ /s.

Individual configuration of the threshold can be done using Table 6–5. However, the internal setting used by the standard selection is recommended.

The optimum NICAM sound can be assigned to the MSP output channels by selecting one of the “Stereo or A/B”, “Stereo or A”, or “Stereo or B” source channels

6.3.1.2. Function in Manual Mode

If the manual mode (MODUS[0]=0) is required, the activation and configuration of the Automatic Switching feature has to be done as described in Table 6–6. Note that the channel matrix of the corresponding output-channels must be set according to the NICAM-mode and need not to be changed in the FM/AM-fallback case.

Example:
Required threshold = 500: bits[10:1] = 00 1111 1010

Table 6–5: Coding of Automatic NICAM/Analog Sound Switching; **Automatic Sound Select is on (MODUS[0] = 1)**

Mode	Description	AUTO_FM [11:0] Addr. = 00 21_{hex}	ERROR_RATE-Threshold/dec	Source Select: Input at NICAM Path[1)]
1 Default	Automatic Switching with **internal** threshold	bit[11:0] = 0	700	NICAM or FM/AM, depending on ERROR_RATE
2	Automatic Switching with **external** threshold (Customizing of Automatic Sound Select)	bit[11] = 0 bit[10:1] = 25...1000 = threshold/2 bit[0] = 1	set by customer; recommended range: 50...2000	
3	Forced Analog Mono	bit[11] = 1 bit[10:1] = ignored bit[0] = 1		always FM/AM

[1)] The NICAM path may be assigned to “Stereo or A/B”, “Stereo or A”, or “Stereo or B” source channels (see Table 2–2 on page 13).

Table 6–6: Coding of Automatic NICAM/Analog Sound Switching;
Automatic Sound Select is off (MODUS[0] = 0)

Mode	Description	AUTO_FM [11:0] Addr. = 00 21_{hex}	ERROR_RATE-Threshold/dec	Source Select: Input at NICAM Path
0 reset status	Forced NICAM (Automatic Switching disabled)	bit[11] = 0 bit[10:1] = 0 bit[0] = 0	none	always NICAM; Mute in case of no NICAM available
1	Automatic Switching with **internal** threshold (Default, if Automatic Sound Select is on)	bit[11] = 0 bit[10:1] = 0 bit[0] = 1	700	NICAM or FM/AM, depending on ERROR_RATE
2	Automatic Switching with **external** threshold (Customizing of Automatic Sound Select)	bit[11] = 0 bit[10:1] = 25...1000 = threshold/2 bit[0] = 1	set by customer; recommended range: 50...2000	
3	Forced Analog Mono (Automatic Switching disabled)	bit[11] = 1 bit[10:1] = 0 bit[0] = 1	none	always FM/AM

6.3.2. A2 Threshold

The threshold between Stereo/Bilingual and Mono Identification for the A2 Standard has been made programmable according to the user's preferences. An internal hysteresis ensures robustness and stability

.

Table 6–7: Write Register on I^2C Subaddress 10_{hex} : A2 Threshold

Register Address	Function	Name
THRESHOLDS		
00 22_{hex} (write)	**A2 THRESHOLD Register** Defines threshold of all A2 and EIA_J standards for Stereo and Bilingual detection bit[15:0] $07F0_{hex}$ force Mono Identification ... 0190_{hex} default setting after reset ... $00A0_{hex}$ minimum Threshold for stable detection recommended range : $00A0_{hex}$...$03C0_{hex}$	A2_THRESH

6.3.3. Carrier-Mute Threshold

The Carrier-Mute threshold has been made programmable according to the user's preferences. An internal hysteresis ensures stable behavior.

Table 6–8: Write Register on I^2C Subaddress 10_{hex} : Carrier-Mute Threshold

Register Address	Function	Name
THRESHOLDS		
00 24_{hex} (write)	**Carrier-Mute THRESHOLD Register** Defines threshold for the carrier mute feature bit[15:0] 0000_{hex} Carrier-Mute always ON (both channels muted) ... $002A_{hex}$ default setting after reset ... $07FF_{hex}$ Carrier-Mute always OFF (both channels forced on) recommended range : 0014_{hex}...0050_{hex}	CM_THRESH

6.3.4. Register AD_CV

The use of this register is no longer recommended. Use it only in cases where compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 44x0G.

Table 6–9: AD_CV Register; reset status: all bits are “0”

AD_CV (00 BB_{hex})			**Automatic setting by STANDARD SELECT Register**	
Bit	**Function**	**Settings**	**2-8, 0A-60$_{hex}$**	**9**
[0]	not used	must be set to 0	0	0
[1:6]	Reference level in case of Automatic Gain Control = on (see Table 6–10). Constant gain factor when Automatic Gain Control = off (see Table 6–11).		101000	100011
[7]	Determination of Automatic Gain or Constant Gain	0 = constant gain 1 = automatic gain	1	1
[8]	Selection of Sound IF source (identical to MODUS[8])	0 = ANA_IN1+ 1 = ANA_IN2+	X	X
[9]	MSP-Carrier-Mute Feature	0 = off: no mute 1 = on: mute as described in section 2.2.2.	1	0
[10:15]	not used	must be set to 0	0	0
X : not affected while choosing the TV sound standard by means of the STANDARD SELECT Register				

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

Table 6–10: Reference Values for Active AGC (AD_CV[7] = 1)

Application	**Input Signal Contains**	**AD_CV [6:1] Ref. Value**	**AD_CV [6:1] in integer**	**Range of Input Signal at pin ANA_IN1+ and ANA_IN2+**
Terrestrial TV				
– FM Standards	1 or 2 FM Carriers	101000	40	0.10 – 3 V_{pp} [1)]
– NICAM/FM	1 FM and 1 NICAM Carrier	101000	40	0.10 – 3 V_{pp} [1)]
– NICAM/AM	1 AM and 1 NICAM Carrier	100011	35	0.10 – 1.4 V_{pp} (recommended: 0.10 – 0.8 V_{pp})
– NICAM only	1 NICAM Carrier only	010100	20	0.05 – 1.0 V_{pp}
SAT	1 or more FM Carriers	100011	35	0.10 – 3 V_{pp} [1)]
ADR	FM and ADR carriers	see DRP 3510A data sheet		

[1)] For signals above 1.4 V_{pp}, the minimum gain of 3 dB is switched, and overflow of the A/D converter may result. Due to the robustness of the internal processing, the IC works up to and even more than 3 V_{pp}, if norm conditions of FM/NICAM or FM1/FM2 ratio are supposed. In this overflow case, a loss of FM-S/N ratio of about 10 dB may appear.

Table 6–11: AD_CV parameters for Constant Input Gain (AD_CV[7]=0)

Step	AD_CV [6:1] Constant Gain	Gain	Input Level at pin ANA_IN1+ and ANA_IN2+
0	000000	3.00 dB	maximum input level: 3 V_{pp} (FM) or 1 V_{pp} (NICAM)[1)]
1	000001	3.85 dB	
2	000010	4.70 dB	
3	000011	5.55 dB	
4	000100	6.40 dB	
5	000101	7.25 dB	
6	000110	8.10 dB	
7	000111	8.95 dB	
8	001000	9.80 dB	
9	001001	10.65 dB	
10	001010	11.50 dB	
11	001011	12.35 dB	
12	001100	13.20 dB	
13	001101	14.05 dB	
14	001110	14.90 dB	
15	001111	15.75 dB	
16	010000	16.60 dB	
17	010001	17.45 dB	
18	010010	18.30 dB	
19	010011	19.15 dB	
20	010100	20.00 dB	maximum input level: 0.14 V_{pp}

1) For signals above 1.4 V_{pp}, the minimum gain of 3 dB is switched and overflow of the A/D converter may result. Due to the robustness of the internal processing, the IC works up to and even more than 3 V_{pp}, if norm conditions of FM/NICAM or FM1/FM2 ratio are supposed. In this overflow case, a loss of FM-S/N ratio of about 10 dB may appear.

6.3.5. Register MODE_REG

Note: The use of this register is no longer recommended. It should be used only in cases where software compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 44x0G.

As soon as this register is applied, the MSP 44x0G works in the **MSP 34x0D Manual/Compatibility Mode**. In this mode, **BTSC, EIA-J, and FM-Radio are disabled**. Only MSP 34x0D features are available; the use of MODUS and STATUS register is not allowed. The MSP 44x0G is reset to the normal mode by first programming the MODUS register, followed by transmitting a valid standard code to the STANDARD SELECTION register.

The register ‘MODE_REG’ contains the control bits determining the operation mode of the MSP 44x0G in the MSP 34x0D Manual/Compatibility Mode; Table 6–12 explains all bit positions.

Table 6–12: Control word ‘MODE_REG’; reset status: all bits are “0”

MODE_REG 00 83_{hex}				Automatic setting by STANDARD SELECT Register		
Bit	**Function**	**Comment**	**Definition**	**2 - 5**	**8, A, B**	**9**
[0]	not used		0 : must be used	0	0	0
[1]	DCTR_TRI	Digital control out 0/1 tri-state	0 : active 1 : tri-state	X	X	X
[2]	I^2S_TRI	I^2S outputs tri-state (I2S_CL, I2S_WS, I2S_DA_OUT)	0 : active 1 : tri-state	X	X	X
[3]	I^2S Mode[1)]	Master/Slave mode of the I^2S bus	0 : Master 1 : Slave	X	X	X
[4]	I^2S_WS Mode	WS due to the Sony or Philips-Format	0 : Sony 1 : Philips	X	X	X
[5]	Audio_CL_OUT	Switch Audio_Clock_Output to tri-state	0 : on 1 : tri-state	X	X	X
[6]	NICAM[1)]	Mode of MSP-Ch1	0 : FM 1 : Nicam	0	1	1
[7]	not used		0 : must be used	0	0	0
[8]	FM AM	Mode of MSP-Ch2	0 : FM 1 : AM	0	0	1

6	FM/AM_Coef (3)	8	
7	FM/AM_Coef (2)	8	
8	FM/AM_Coef (1)	8	
9	FM/AM_Coef (0)	8	

6.3.6. FIR-Parameter, Registers FIR1 and FIR2

Note: The use of this register is no longer recommended. It should be used only in cases where software compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 44x0G.

Data-shaping and/or FM/AM bandwidth limitation is performed by a pair of linear phase Finite Impulse Response filters (FIR-filter). The filter coefficients are programmable and are either configured automatically by the STANDARD SELECT register or written manually by the control processor via the control bus. Two not necessarily different sets of coefficients are required: one for MSP-Ch1 (NICAM or FM2) and one for MSP-Ch2 (FM1 = FM-mono). In Table 6–14 several coefficient sets are proposed.

To load the FIR-filters, the following data values are to be transferred **8 bits at a time embedded LSB-bound in a 16-bit word**.

The loading sequences must be obeyed. To change a coefficient set, the complete block FIR1 or FIR2 must be transmitted.

Note: For compatibility with MSP 3410B, IMREG1 and IMREG2 have to be transmitted. The value for IMREG1 and IMREG2 is 004. Due to the partitioning to 8-bit units, the values 04_{hex}, 40_{hex}, and 00_{hex} arise.

6.3.7. DCO-Registers

Note: The use of this register is no longer recommended. It should be used only in cases where software-compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the MODUS register provides a more economic way to program the MSP 44x0G.

When selecting a TV-sound standard by means of the STANDARD SELECT register, all frequency tuning is performed automatically.

If manual setting of the tuning frequency is required, a set of 24-bit registers determining the mixing frequencies of the quadrature mixers can be written manually into the IC. In Table 6–15, some examples of DCO registers are listed. It is necessary to divide them up into low part and high part. The formula for the calculation of the registers for any chosen IF frequency is as follows:

$$INCR_{dec} = int(f/fs \cdot 2^{24})$$

with: int = integer function
f = IF frequency in MHz
f_S = sampling frequency (18.432 MHz)

Conversion of INCR into hex-format and separation of the 12-bit low and high parts lead to the required register values (DCO1_HI or _LO for MSP-Ch1, DCO2_HI or LO for MSP-Ch2).

Table 6–14: 8-bit FIR-coefficients (decimal integer) for MSP 34x0D; reset status: all coefficients are “0”

Coefficients for FIR1 00 01_{hex} and FIR2 00 05_{hex}														
	Terrestrial TV Standards							**FM - Satellite** FIR filter corresponds to a band-pass with a band-width of B = 130 to 500 kHz 						
	B/G-, D/K-NICAM-FM		**I-NICAM-FM**		**L-NICAM-AM**		**B/G-, D/K-, M-Dual FM**	**130 kHz**	**180 kHz**	**200 kHz**	**280 kHz**	**380 kHz**	**500 kHz**	**Auto-search**
Coef(i)	**FIR1**	**FIR2**	**FIR1**	**FIR2**	**FIR1**	**FIR2**	**FIR2**	**FIR2**	**FIR2**	**FIR2**	**FIR2**	**FIR2**	**FIR2**	**FIR2**
0	–2	3	2	3	–2	–4	3	73	9	3	–8	–1	–1	–1
1	–8	18	4	18	–8	–12	18	53	18	18	–8	–9	–1	–1
2	–10	27	–6	27	–10	–9	27	64	28	27	4	–16	–8	–8
3	10	48	–4	48	10	23	48	119	47	48	36	5	2	2
4	50	66	40	66	50	79	66	101	55	66	78	65	59	59
5	86	72	94	72	86	126	72	127	64	72	107	123	126	126
Mode-REG[12]	0		0		0		0	1	1	1	1	1	1	0
Mode-REG[13]	0		0		0		1	1	1	1	1	1	1	0
For compatibility, except for the FIR2-AM and the Autosearch-sets, the FIR-filter programming as used for the MSP 3410B is also possible.														
ADR coefficients are listed in the DRP data sheet.														

Table 6–15: DCO registers for the MSP 44x0G; reset status: DCO_HI/LO = “0000”

DCO1_LO 00 93_{hex}, DCO1_HI 00 $9B_{hex}$; DCO2_LO 00 $A3_{hex}$, DCO2_HI 00 AB_{hex}

7.38	0668	0000	7.56	0690	0000

6.4. Manual/Compatibility Mode: Description of Demodulator Read Registers

Note: The use of these register is no longer recommended. It should be used only in cases where software compatibility to the MSP 34x0D is required. Using the STANDARD SELECTION register together with the STATUS register provides a more economic way to program the MSP 44x0G and to retrieve information from the IC.

All registers except C_AD_BITs are 8 bits wide. They can be read out of the RAM of the MSP 44x0G if the MSP 34x0D Manual/Compatibility Mode is required.

All transmissions take place in 16-bit words. The valid 8-bit data are the 8 LSBs of the received data word.

If the Automatic Sound Select feature is not used, the NICAM or FM-identification parameters must be read and evaluated by the controller in order to enable appropriate switching of the channel select matrix of the baseband processing part. The FM-identification registers are described in section 6.6.1. To handle the NICAM-sound and to observe the NICAM-quality, at least the registers C_AD_BITS and ERROR_RATE must be read and evaluated by the controller. Additional data bits and CIB bits, if supplied by the NICAM transmitter, can be obtained by reading the registers ADD_BITS and CIB_BITS.

6.4.1. NICAM Mode Control/Additional Data Bits Register

NICAM operation mode control bits and A[2:0] of the additional data bits.

Format:

MSB		C_AD_BITS 00 23_{hex}							LSB
11	...	7	6	5	4	3	2	1	0
Auto _FM	...	A[2]	A[1]	A[0]	C4	C3	C2	C1	S

Important: “S” = Bit[0] indicates correct NICAM-synchronization (S = 1). If S = 0, the MSP 4410/4450G has not yet synchronized correctly to frame and sequence, or has lost synchronization. The remaining read registers are therefore not valid. The MSP mutes the NICAM output automatically and tries to synchronize again as long as MODE_REG[6] is set.

The operation mode is coded by C4-C1 as shown in Table 6–16.

Table 6–16: NICAM operation modes as defined by the EBU NICAM 728 specification

C4	C3	C2	C1	Operation Mode
0	0	0	0	Stereo sound (NICAMA/B), independent mono sound (FM1)
0	0	0	1	Two independent mono signals (NICAMA, FM1)
0	0	1	0	Three independent mono channels (NICAMA, NICAMB, FM1)
0	0	1	1	Data transmission only; no audio
1	0	0	0	Stereo sound (NICAMA/B), FM1 carries same channel
1	0	0	1	One mono signal (NICAMA). FM1 carries same channel as NICAMA
1	0	1	0	Two independent mono channels (NICAMA, NICAMB). FM1 carries same channel as NICAMA
1	0	1	1	Data transmission only; no audio
x	1	x	x	Unimplemented sound coding option (not yet defined by EBU NICAM 728 specification)
AUTO_FM: monitor bit for the AUTO_FM Status: 0: NICAM source is NICAM 1: NICAM source is FM				

Note: It is no longer necessary to read out and evaluate the C_AD_BITS. All evaluation is performed in the MSP and indicated in the STATUS register.

6.4.2. Additional Data Bits Register

Contains the remaining 8 of the 11 additional data bits. The additional data bits are not yet defined by the NICAM 728 system.

Format:

MSB	ADD_BITS 00 38_{hex}						LSB
7	6	5	4	3	2	1	0
A[10]	A[9]	A[8]	A[7]	A[6]	A[5]	A[4]	A[3]

6.4.3. CIB Bits Register

CIB bits 1 and 2 (see NICAM 728 specifications).

Format:

MSB	CIB_BITS 00 $3E_{hex}$						LSB
7	6	5	4	3	2	1	0
x	x	x	x	x	x	CIB1	CIB2

6.4.4. NICAM Error Rate Register

ERROR_RATE	**00 57_{hex}**
Error free	0000_{hex}
maximum error rate	$07FF_{hex}$

Average error rate of the NICAM reception in a time interval of 182 ms, which should be close to 0. The initial and maximum value of ERROR_RATE is 2047. This value is also active if the NICAM bit of MODE_REG is not set. Since the value is achieved by filtering, a certain transition time (approx. 0.5 sec) is unavoidable. Acceptable audio may have error rates up to a value of 700 int. Individual evaluation of this value by the controller and an appropriate threshold may define the fallback mode from NICAM to FM/AM-Mono in case of poor NICAM reception.

The bit error rate per second (BER) can be calculated by means of the following formula:

$BER = ERROR\_RATE * 12.3*10^{-6} /s$

6.4.5. PLL_CAPS Readback Register

It is possible to read out the actual setting of the PLL_CAPS. In standard applications, this register is not of interest for the customer.

PLL_CAPS	**02 $1F_{hex}$ L**	
minimum frequency	1111 1111	FF_{hex}
nominal frequency	0101 0110 RESET	56_{hex}
maximum frequency	0000 0000	00_{hex}
PLL_CAPS	**02 $1F_{hex}$ H**	
PLL open	xxxx xxx0	
PLL closed	xxxx xxx1	

6.4.6. AGC_GAIN Readback Register

It is possible to read out the actual setting of AGC_GAIN in Automatic Gain Mode. In standard applications, this register is not of interest for the customer.

AGC_GAIN	**02 $1E_{hex}$**	
max. amplification (20 dB)	0001 0100	14_{hex}
min. amplification (3 dB)	0000 0000	00_{hex}

6.4.7. Automatic Search Function for FM-Carrier Detection in Satellite Mode

The AM demodulation ability of the MSP 4410G and MSP 4450G offers the possibility to calculate the “field strength” of the momentarily selected FM carrier, which can be read out by the controller. In SAT receivers, this feature can be used to make automatic FM carrier search possible.

For this, the MSP has to be switched to AM-mode (MODE_REG[8]), FM-Prescale must be set to $7F_{hex} = +127_{dec}$, and the FM DC notch (see section 6.5.7.) must be switched off. The sound-IF frequency range must now be “scanned” in the MSP-channel 2 by means of the programmable quadrature mixer with an appropriate incremental frequency (i.e. 10 kHz). After each incrementation, a field strength value is available at the quasi-peak detector output (quasi-peak detector source must be set to FM), which must be examined for relative maxima by the controller. This results in either continuing search or switching the MSP back to FM demodulation mode.

During the search process, the FIR2 must be loaded with the coefficient set “AUTOSEARCH”, which enables small bandwidth, resulting in appropriate field strength characteristics. The absolute field strength value (can be read out of “quasi-peak detector output FM1”) also gives information on whether a main FM carrier or a subcarrier was detected; and as a practical consequence, the FM bandwidth (FIR1/2) and the deemphasis (50 µs or adaptive) can be switched accordingly.

Due to the fact that a constant demodulation frequency offset of a few kHz leads to a DC level in the demodulated signal, further fine tuning of the found carrier can be achieved by evaluating the “DC Level Readout FM1”. Therefore, the FM DC Notch must be switched on, and the demodulator part must be switched back to FM-demodulation mode.

For a detailed description of the automatic search function, please refer to the corresponding MSP Windows software.

6.5. Manual/Compatibility Mode: Description of DSP Write Registers

6.5.1. Additional Channel Matrix Modes

Loudspeaker Matrix	**00 08_{hex}**	**L**
Headphone Matrix	**00 09_{hex}**	**L**
SCART1 Matrix	**00 $0A_{hex}$**	**L**
SCART2 Matrix	**00 41_{hex}**	**L**
I^2S Matrix	**00 $0B_{hex}$**	**L**
Quasi-Peak Detector Matrix	**00 $0C_{hex}$**	**L**
SUM/DIFF	0100 0000	40_{hex}
AB_XCHANGE	0101 0000	50_{hex}
PHASE_CHANGE_B	0110 0000	60_{hex}
PHASE_CHANGE_A	0111 0000	70_{hex}
A_ONLY	1000 0000	80_{hex}
B_ONLY	1001 0000	90_{hex}

This table shows additional modes for the channel matrix registers.

The sum/difference mode can be used together with the quasi-peak detector to determine the sound material mode. If the difference signal on channel B (right) is near to zero, and the sum signal on channel A (left) is high, the incoming audio signal is mono. If there is a significant level on the difference signal, the incoming audio is stereo.

6.5.2. Volume Modes of SCART1/2 Outputs

Volume Mode SCART1	**00 07_{hex}**	**[3:0]**
Volume Mode SCART2	**00 40_{hex}**	**[3:0]**
linear	0000 RESET	0_{hex}
logarithmic	0001	1_{hex}

Linear Mode		
Volume SCART1	**00 07_{hex}**	**H**
Volume SCART2	**00 40_{hex}**	**H**
OFF	0000 0000 RESET	00_{hex}
0 dB gain (digital full scale (FS) to 2 V_{RMS} output)	0100 0000	40_{hex}
+6 dB gain (–6 dBFS to 2 V_{RMS} output)	0111 1111	$7F_{hex}$

Note: SCART Volume linear mode will not be supported in the future (documented for compatibility reasons only).

6.5.3. FM Fixed Deemphasis

FM Deemphasis	**00 $0F_{hex}$**	**H**
50 µs	0000 0000 RESET	00_{hex}
75 µs	0000 0001	01_{hex}
J17	not available	
OFF	0011 1111	$3F_{hex}$

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

6.5.4. FM Adaptive Deemphasis

FM Adaptive Deemphasis WP1	**00 $0F_{hex}$**	**L**
OFF	0000 0000 RESET	00_{hex}
WP1	0011 1111	$3F_{hex}$

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

6.5.5. NICAM Deemphasis

A J17 Deemphasis is always applied to the NICAM signal. It is not switchable.

6.5.6. Identification Mode for A2 Stereo Systems

Identification Mode	**00 15_{hex}** **L**
Standard B/G (German Stereo)	0000 0000 RESET 00_{hex}
Standard M (Korean Stereo)	0000 0001 01_{hex}
Reset of Ident-Filter	0011 1111 $3F_{hex}$

To shorten the response time of the identification algorithm after a program change between two FM-Stereo capable programs, the reset of the ident-filter can be applied.

Sequence:

1. Program change
2. Reset ident-filter
3. Set identification mode back to standard B/G or M
4. Wait approx. 500 ms
5. Read stereo detection register

Note: This register is initialized during STANDARD SELECTION and is automatically updated when Automatic Sound Select (MODUS[0]=1) is on.

6.5.7. FM DC Notch

The DC compensation filter (FM DC Notch) for FM input can be switched off. This is used to speed up the automatic search function (see Section 6.4.7.). In normal FM-mode, the FM DC Notch should be switched on.

FM DC Notch	**00 17_{hex}** **L**
ON	0000 0000 Reset 00_{hex}
OFF	0011 1111 $3F_{hex}$

6.6. Manual/Compatibility Mode: Description of DSP Read Registers

All readable registers are 16-bit wide. Transmissions via I^2C bus have to take place in 16-bit words. Some of the defined 16-bit words are divided into low and high byte, thus holding two different control entities.

These registers are not writable.

6.6.1. Stereo Detection Register for A2 Stereo Systems

Stereo Detection Register	**00 18_{hex}** **H**
Stereo Mode	Reading (two's complement)
MONO	near zero
STEREO	positive value (ideal reception: $7F_{hex}$)
BILINGUAL	negative value (ideal reception: 80_{hex})

Note: It is no longer necessary to read out and evaluate the A2 identification level. All evaluation is performed in the MSP and indicated in the STATUS register.

6.6.2. DC Level Register

DC Level Readout FM1 (MSP-Ch2)	**00 $1B_{hex}$** **H+L**
DC Level Readout FM2 (MSP-Ch1)	**00 $1C_{hex}$** **H+L**
DC Level	[8000_{hex} ... $7FFF_{hex}$] values are 16 bit two's complement

The DC level register measures the DC component of the incoming FM signals (FM1 and FM2). This can be used for seek functions in satellite receivers and for IF FM frequencies fine tuning. A too low demodulation frequency (DCO) results in a positive DC-level and vice versa. For further processing, the DC content of the demodulated FM signals is suppressed. The time constant τ, defining the transition time of the DC Level Register, is approximately 28 ms.

6.7. Demodulator Source Channels in Manual Mode

6.7.1. Terrestric Sound Standards

Table 6–17 shows the source channel assignment of the demodulated signals in case of manual mode for all terrestric sound standards. See Table 2–2 for the assignment in the Automatic Sound Select mode. In manual mode for terrestric sound standards, only two demodulator sources are defined.

6.7.2. SAT Sound Standards

Table 6–18 shows the source channel assignment of the demodulated signals for SAT sound standards.

Table 6–17: Manual Sound Select Mode for Terrestric Sound Standards

				Source Channels of Sound Select Block	
Broadcasted Sound Standard	**Selected MSP Standard Code**	**Broadcasted Sound Mode**	**FM Matrix**	**FM/AM** (use 0 for channel select)	**Stereo or A/B** (use 1 for channel select)
B/G-FM D/K-FM M-Korea M-Japan	03 04, 05 02 30	MONO	Sound A Mono	Mono	Mono
		STEREO	German Stereo Korean Stereo	Stereo	Stereo
		BILINGUAL, Languages A and B	No Matrix	Left = A Right = B	Left = A Right = B
B/G-NICAM L-NICAM I-NICAM D/K-NICAM D/K-NICAM (with high deviation FM)	08 09 0A 0B 0C 0D	NICAM not available or NICAM error rate too high	Sound A Mono[1)]	analog Mono	no sound with AUTO_FM: analog Mono
		MONO	Sound A Mono[1)]	analog Mono	NICAM Mono
		STEREO	Sound A Mono[1)]	analog Mono	NICAM Stereo
		BILINGUAL, Languages A and B	Sound A Mono[1)]	analog Mono	Left = NICAM A Right = NICAM B
BTSC	20	MONO	Sound A Mono	Mono	Mono
		STEREO	Korean Stereo	Stereo	Stereo
		MONO + SAP	Sound A Mono	Mono	Mono
		STEREO + SAP	Korean Stereo	Stereo	Stereo
	21	MONO	Sound A Mono	Mono	Mono
		STEREO			
		MONO + SAP	No Matrix	Left = Mono Right = SAP	Left = Mono Right = SAP
		STEREO + SAP			
FM-Radio	40	MONO	Sound A Mono	Mono	Mono
		STEREO	Korean Stereo	Stereo	Stereo

[1)] Automatic refresh to Sound A Mono, do not write any other value to the register FM Matrix!

Table 6–18: Manual Sound Select Modes for SAT-Standards

				Source Channels of Sound Select Block for SAT-Modes		
Broadcasted Sound Standard	**Selected MSP Standard Code**	**Broadcasted Sound Mode**	**FM Matrix**	**FM/AM** (source select: 0)	**Stereo or A/B** (source select: 1**)**	**Stereo or A** (source select: 3)
FM SAT	$6, 50_{hex}$	MONO	Sound A Mono	Mono	Mono	Mono
	51_{hex}	STEREO	No Matrix	Stereo	Stereo	Stereo
		BILINGUAL	No Matrix	Left = A (FM1) Right = B (FM2)	Left = A (FM1) Right = B (FM2)	A (FM1)

7. Appendix D: Application Information

7.1. Exclusions of Audio Baseband Features

In general, all functions can be switched independently. Two exceptions exist:

1. NICAM cannot be processed simultaneously with the FM2 channel.
2. FM adaptive deemphasis cannot be processed simultaneously with FM-identification.

7.2. Phase Relationship of Analog Outputs

The analog output signals: Loudspeaker, headphone, and SCART2 all have the same phases. The user does not need to correct output phases when using these analog outputs directly. The SCART1 output has opposite phase.

Using the I^2S-outputs for other DSPs or D/A converters, care must be taken to adjust for the correct phase. If the attached coprocessor is one of the MSP family, the following schematics help to determine the phase relationship.

7.3. Compatibility Restrictions to MSP 34x0D

The MSP 44x0G is fully hardware compatible to the MSP 34x0D. However, to substitute a MSP 34x0D by the corresponding MSP 44x0G, the controller software has to be adapted slightly:

1. The register FM-Matrix (00 $0E_{hex}$ low part) must be changed from “no matrix (00_{hex})” to “sound A mono (03_{hex})” during mono transmission of all TV-sound standards (see also Table 6–17).
2. With the MSP 44x0G, the STANDARD SELECTION initializes the FM-deemphasis, which is not the case for the MSP 34x0D. So, if STANDARD SELECTION is applied, this I^2C instruction can be omitted.

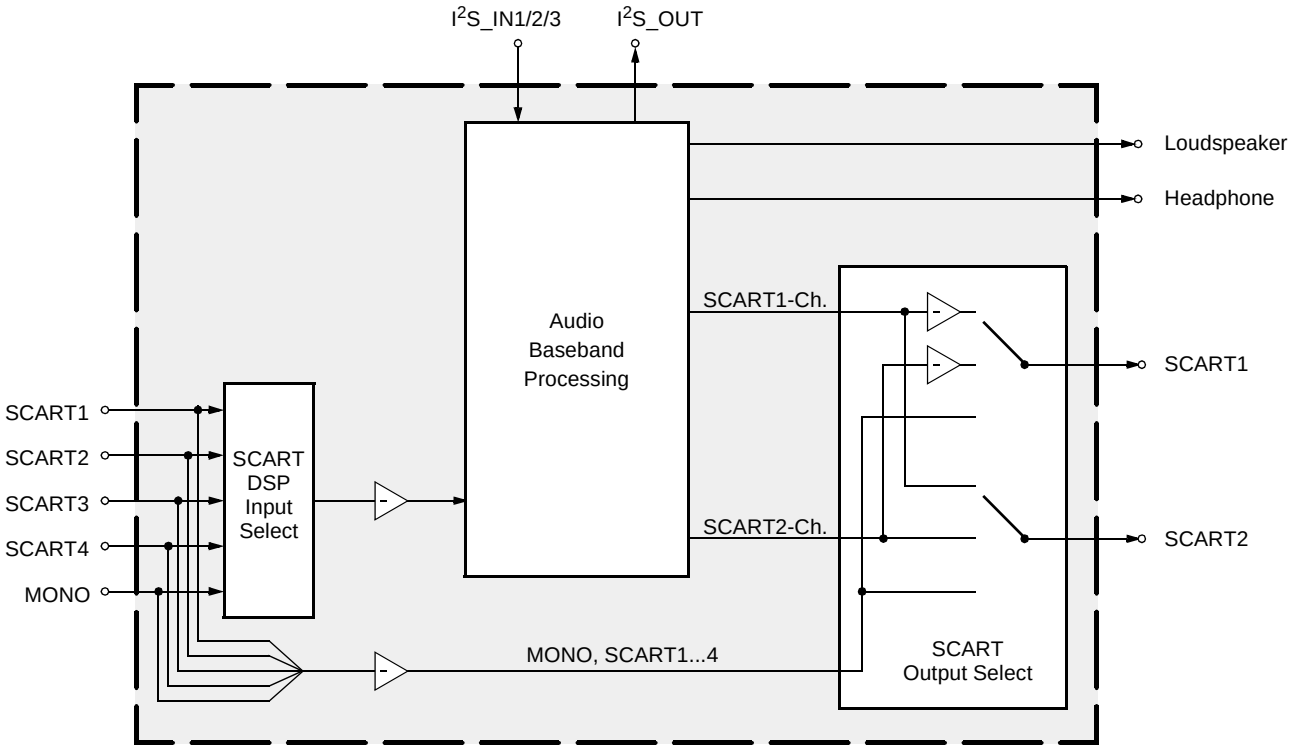

Fig. 7–1: Phase diagram of the MSP 44x0G

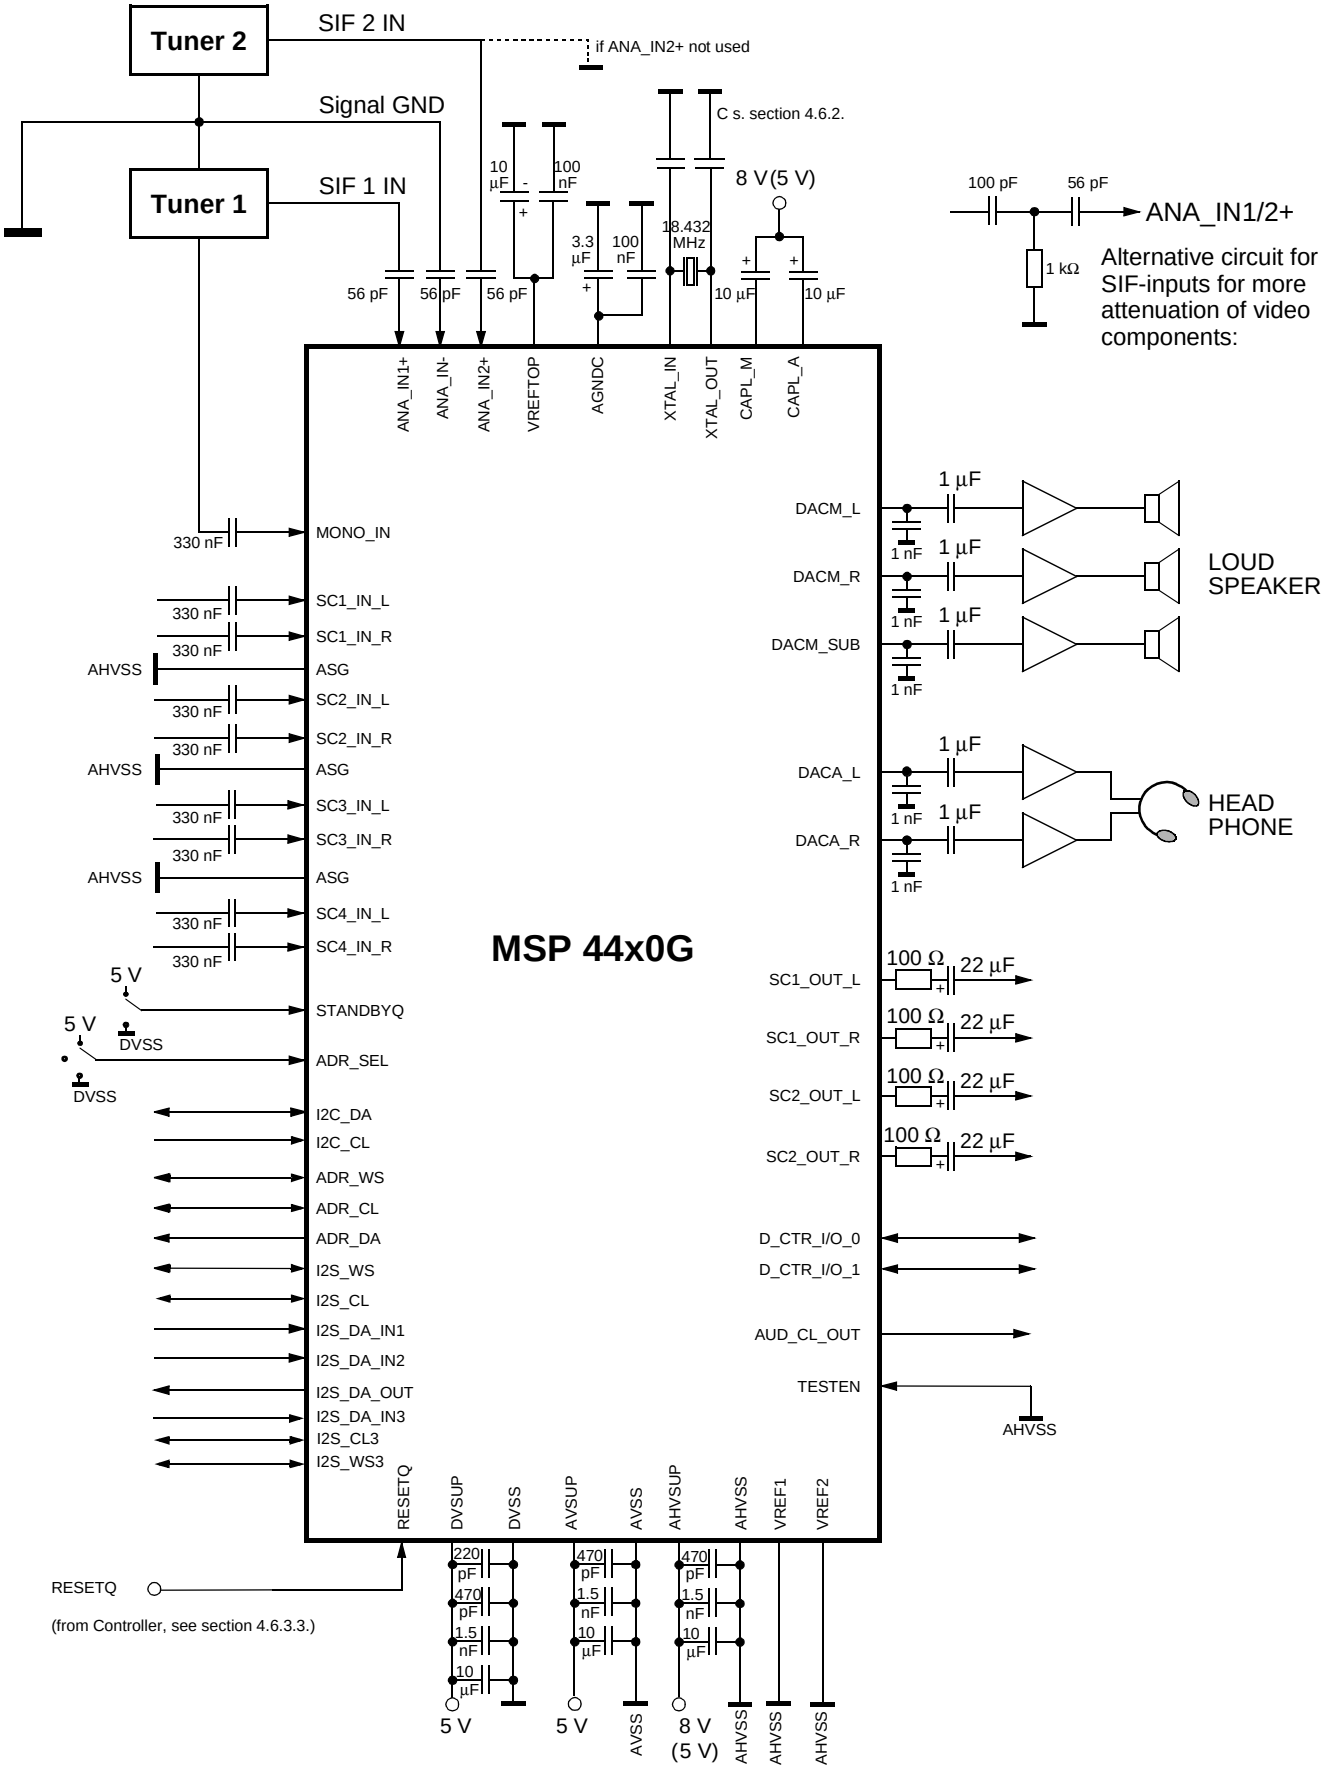
7.4. Application Circuit



8. Appendix E: MSP 44x0G Version History

MSP 3450G-B8

First release for Multichannel application together with DPL 4519G and MAS 3528E.

9. Data Sheet History

1. Preliminary data sheet: “MSP 44x0G Multistandard Sound Processor Family”, May 16, 2001, 6251-533-1PD. First release of the preliminary data sheet.
