## ■ LOGIC DIAGRAM (positive logic)

## ■ ABSOLUTE MAXIMUM RATINGS (unless otherwise specified)(Note 2)

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	$V_{CC}$	-0.5~7	V
Enable Input Voltage	$V_E$	-0.5~7	V
Enable Input Clamp Current	$I_{EK}$	-20	mA
Switch Diode Current	$I_{SK}$	$\pm 20$	mA
On-State Switch Current(-0.5V < $V_{OS}$ < $V_{CC}+0.5V$ )	$I_S$	$\pm 25$	mA
$V_{CC}$ or GND Current	$I_{CC}$	$\pm 75$	mA
Power Dissipation	$P_D$	250	mW
Storage Temperature	$T_{STG}$	-65 ~ +150	°C

Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged.

Absolute maximum ratings are stress ratings only and functional device operation is not implied.

- The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
- To avoid drawing  $V_{CC}$  current out of pin Z, when switch current flows into pin Y, the voltage drop across the bidirectional switch must not exceed 0.4V. If the switch current flows into pin Z, no  $V_{CC}$  current will flow out of pin Y. In this case there is no limit for the voltage drop across the switch, but the voltage at pins Y and Z may not exceed  $V_{CC}$  or GND.
