

LR1121B

CMOS IC

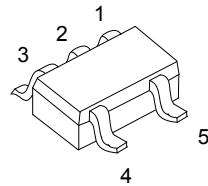

HIGH RIPPLE-REJECTION LDO REGULATOR

■ DESCRIPTION

The UTC **LR1121B** is CMOS-based voltage regulator ICs with high output voltage accuracy, extremely low current, low ON-resistance, and high Ripple Rejection.

An ON/OFF circuit enables the output to be turned off, ensuring a long battery life. a built-in low on-resistance transistor provides a low dropout voltage and large output current, and a built-in overcurrent protector prevents the load current from exceeding the current capacitance of the output transistor.

The line transient response and load transient of the UTC **LR1121B** is excellent.

SOT-25

■ FEATURES

- * Ultra-Low Supply Current :
 - During Operation: 30 μ A TYP.
 - During Standby: 0.1 μ A Typ.
- * Output Voltage: 2.1V ~ 5.5V, Selectable in 0.1 V Steps.
- * High Output Voltage Accuracy: $\pm 2.0\%$
- * Low Dropout Voltage: 180 mV Typ. (2.8 V Output Product, $I_{OUT} = 100$ mA)
- * High Ripple Rejection: 70 dB TYP. (@ 1.0 kHz)
- * Low Temperature-Drift Coefficient of Output Voltage: ± 100 ppm/ $^{\circ}$ C TYP.
- * High Peak Current Capability: 150 mA Output is Possible (@ $V_{IN} \geq V_{OUT(S)} + 1.0$ V)

Note:

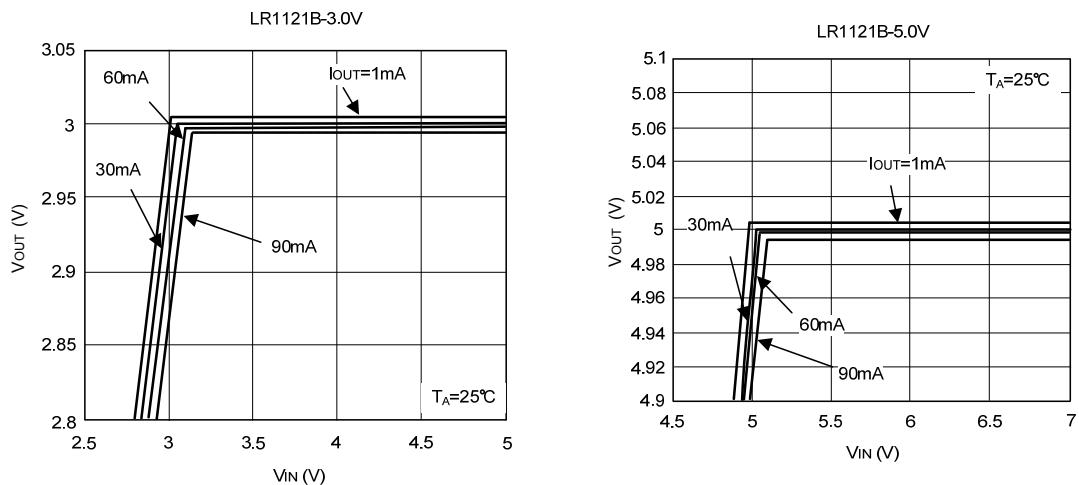

Input capacitor (C_{IN}): 1.0 μ F or moreOutput capacitor (C_L): 2.2 μ F or more (tantalum capacitor)

■ SELECTION OF OUTPUT CAPACITOR (C_L)

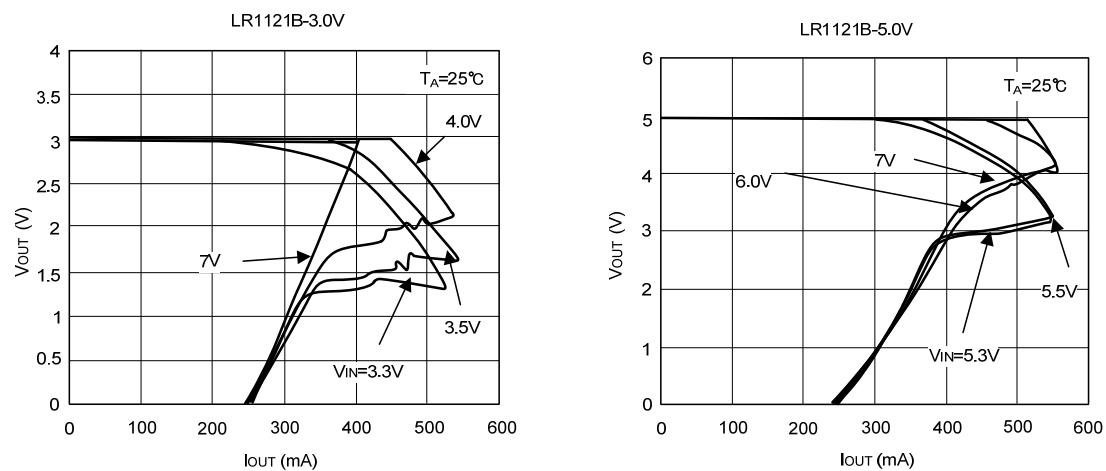

In this IC, phase compensation and the output capacitor is made for securing stable operation even if the load current is varied. Therefore, always place a capacitor (C_L) of 2.2 μ F or more between V_{OUT} and V_{SS} pins. Using a capacitor whose ESR is outside the optimum range (approximately 0.5 ~ 5 Ω), whether larger or smaller, may cause an unstable output, resulting in oscillation. For this reason, a tantalum electrolytic capacitor is recommended.
