DESCRIPTION

The APE8833 series are low dropout, positive linear regulators with very low quiescent current. The APE8833 can supply 300mA output current with a low dropout voltage.

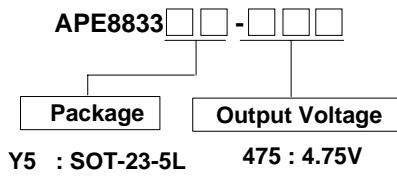

The APE8833 regulator is able to operate with output capacitors as small as 1 μ F for stability. Other than the current limit protection APE8833 also offers on chip thermal shutdown feature providing protection against overload or any condition when the ambient temperature exceeds the junction temperature.

The APE8833 series are offering several fixed output voltage types and low-profile ,space-saving SOT-23-5L package.

junction temperature as close to ambient as possible.

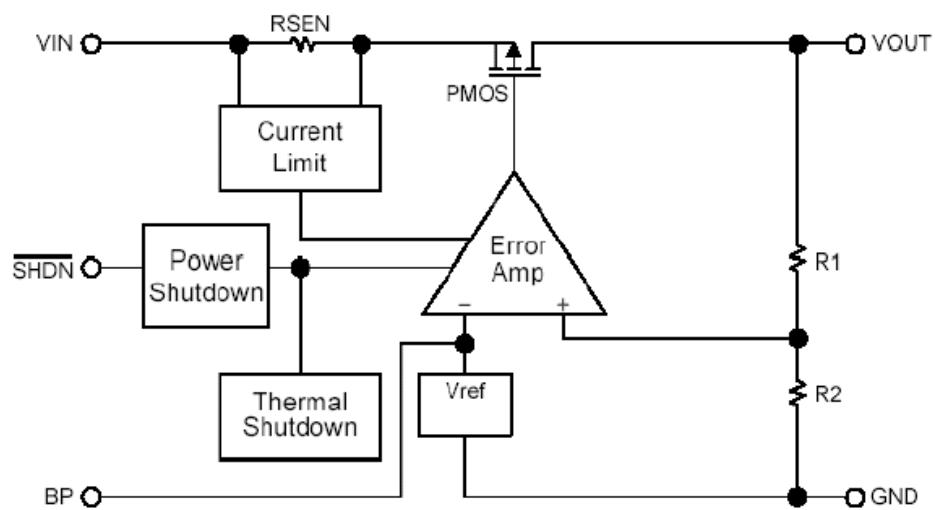

Note2. Regulation is measured at a constant junction temperature by using 30ms current pulse and load regulation in the load range from 0mA to 300mA.

PIN DESCRIPTIONS

PIN SYMBOL	PIN DESCRIPTION
VIN	Power is supplied to this device from this pin which is required an input filter capacitor. In general, the input capacitor in the range of $1\mu F$ to $10\mu F$ is sufficient.
GND	Common ground pin
SHDN	Chip Enable (Active High)
BP	Reference Noise Bypass (the Bypass Capacitor $\geq 1nF$)
VOUT	The output supplies power to loads. The output capacitor is required to prevent output voltage unstable. The APE8833 is stable with an output capacitor $1\mu F$ or greater. The larger output capacitor will be required for application with large transit load to limit peak voltage transits, besides could reduce output noise, improve stability, PSRR.
