6. Function Specifications

6.1 Introduction

XYF480272C-TP is a text/graphic mixed display with 2 layers TFT LCD. The Advanced geometric speed-up engine provides user an easy way to draw the programmable Geometric shapes by hardware, like line, square, circle and ellipse. Besides, for different End-user applications, many powerful functions are integrated with the lcm, such as scroll function, floating window display, graphic pattern and font enlargement function. These function will save user a large of effort during development period.

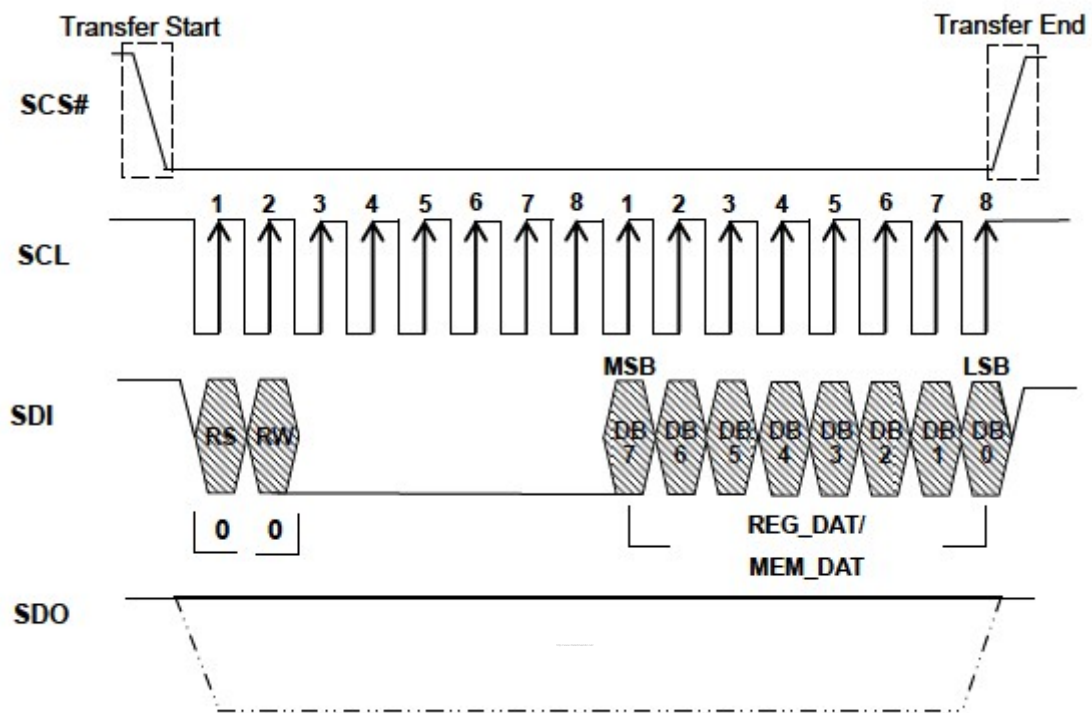

6.2 Resetting the LCD module

Before programming the LCM, it' s suggested that a reset process should be done. The LCM requires a reset low pulse at least 27us.

6.3 Transmission protocol

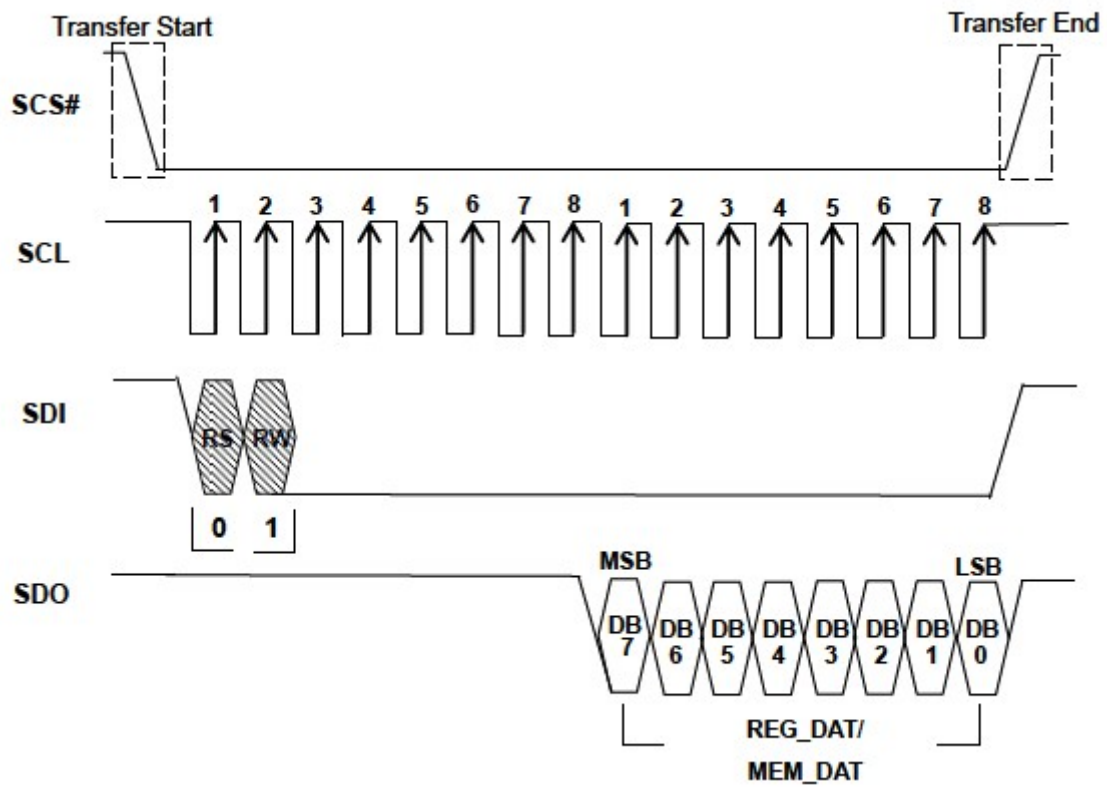

SDI is the data pin from the SPI master, SDO is the data output from the SPI slave. About the detail protocol, please refer to Figure.

6.4 Interrupt

There are 2 kinds of interrupt events for LCM, each maps to the corresponding status Bits in REG[F1h]:

- ◆ Touch event occurs. Bit 2 of REG[F1h] is set to 1.
- ◆ The font access is completed. Bit 0 of REG[F1h] is set to 1.

All of the above interrupts function can be enable/disable by setting INTC1(REG[F0h]), In addition, if the system of customer can not provide the hardware interrupt, The LCM also supports a software polling method, MCU can detect the

ZOLEN, OFFERS YOU THE BEST SERVICE AND HIGH QUALITY!!!

interrupt status through the related status flag. When hardware interrupts of LCM are active, the related interrupt masks must be disabled first. There is an example for describing the interrupt procedure of Touch Panel as below:

- ◆ LCM sends an interrupt signal to MCU.
- ◆ When MCU receives interrupt signal, the program counter(PC) will jump to ISR Start address.
- ◆ In the mean time, the corresponding interrupt status flag of LCM will be set to “1” (REG[F1h]). For example, When Touch event generates an interrupt, The touch panel Interrupt Status bit will be set to “1” .
- ◆ After the ISR completes, the status flag should be cleared , i.e., Write “1” to The corresponding bit of status register.

By software interrupt, user can read INTC2 register for detecting interrupt event Without any external device. Besides, Interrupt mask function is only applied to Hardware interrupt, not to INTC2 status flag. It should be noted that, INTC2 status Flag must be cleared manually at the tail of ISR, i.e., writing the Bit2 of Register INTC2 (REG[F1h]) with 1, because the INTC2 status flag will not be cleared Automatically.

6.5 Data Format

The LCM supports the 16-bit color depth TFT-LCD Panle, .i.e 65K colors TFT LCD panel

Figure 3 Shows the standard characters of ISO/IEC 8859-3. ISO/IEC 8859-3 also known as Latin-3 or "South European" is an 8-bit character encoding, third part of the ISO/IEC 8859 standard. It was designed originally to cover Turkish, Maltese and Esperanto, though the introduction of ISO/IEC 8859-9 superseded it for Turkish. The encoding remains popular with users of Esperanto and Maltese, though it also supports English, German, Italian, Latin and Portuguese.

8-2 CGRAM

XYF480272C-TP supports 256 half size space that lets user can create fonts or symbols the want. User just writes the font or symbol data to the indicated space and then writes the corresponding font code, LCM will write the font or symbol to the DDRAM. Also, user can choose the font foreground color by setting the REG[63h~65h] and background color by setting the REG[60h~62h]. The procedure of creating and writing just refers to below figure:

9-1 Circle Input

XYF480272C-TP supports hardware circle drawing function on the DDRAM. User can largely reduce the effort MCU by the function. By setting the center of circle REG[99h~9Ch], the radius of a circle REG[9Dh] and the color of circle REG[63h~65h], and then setting start draw REG[90h]Bit6=1, LCM will implements a corresponding circle on the DDRAM automatically. Moreover, user can decide whether to fill the circle by setting REG[90h]Bit5 as 0(not fill) or 1(fill). The procedure of drawing circle just refers to the below figure:

9-2 Ellipse Input

XYF480272C-TP supports draw ellipse drawing function makes user to draw ellipse on the DDRAM only use bu few MCU cycles. By setting the center of ellipse REG[A5h-A8h], the long and short axis of ellipse REG[A1h-A4], the color of ellipse REG[63h-65h], the draw ellipse condition REG[A0h]Bit5=0 and Bit4=0, and then setting start draw REG[A0h]Bit7=1, LCM will draw a corresponding Ellipse on the DDRAM. Moreover, user can fill the circle by setting REG[A0h]Bit6=1. The procedure of Drawing ellipse just refers to the below figure:

10.Touch Panel Function

There are 2 detection methods provided by LCM.Hardware interrupt mode or software polling Mode.

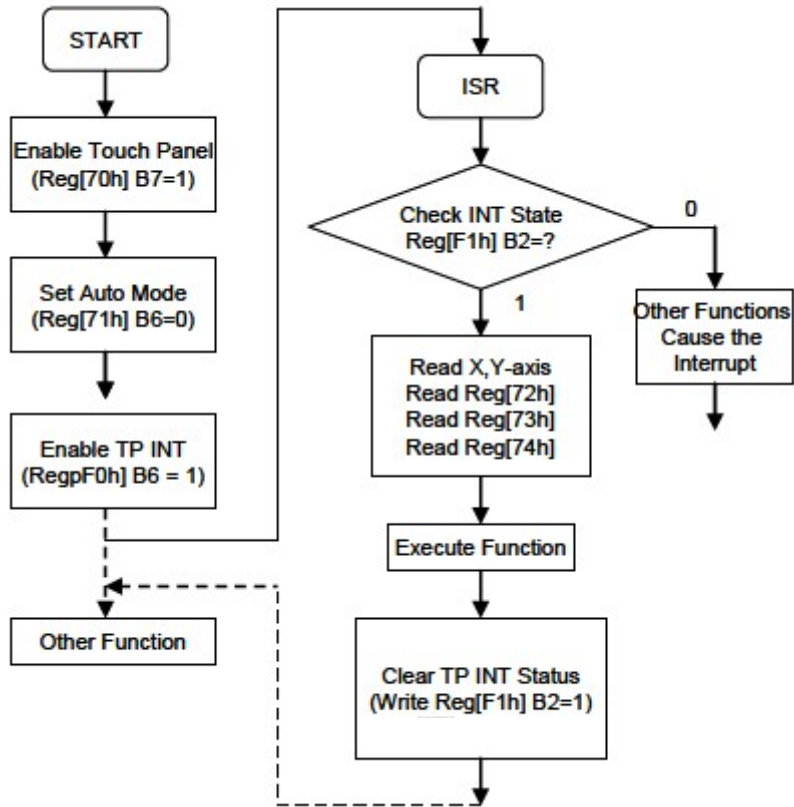

10-1-1 Auto Mode

Auto mode is the easiest way to implement Touch Panel application.User only needs to enable the related Register and LCM will execute the touch panel function and latch the touch data automatically. .

| Operation Mode | Event Detection | Description |
|----------------|-----------------|---|
| Auto | Interrupt | When touch event happens,read the corresponding X,Y coordination. |
| | Polling | Polling the touch event,read the correspondingX,Y coordination. |
| Manual | Interrupt | Set the operation state to “Checking touch event”for checking the touch event,when touch event interrupt happens,set the state to ‘Latch_X_data”and”Latch_Y_data”for latching the corresponding X,Y coordination,then read the X,Y data |

| | | and set operation state to “Idle state” |
| | Polling | 持续轮询触控事件，之后切换触摸屏的相位，再读回对应的 XY 坐标值。 |

Auto mode Flowchart for Touch Panel

| Reg. | Bit_Num | Description | Reference |
|-------|----------|-------------------------------|-----------|
| TPCR0 | Bit7 | Enable Touch Panel function | REG[70h] |
| TPCR1 | Bit6 | “Auto-Mode”=0 | REG[71h] |
| | Bit2 | Set de-bounce enable for ADET | |
| TPXH | Bit[7:0] | Touch Panel SEG data MSB byte | REG[72h] |
| TPYH | Bit[7:0] | Touch Panel COM data MSB byte | REG[73h] |
| TPXYL | Bit[3:2] | Touch Panel COM data LSB 2bit | REG[74h] |
| | Bit[1:0] | Touch Panel SEG data LSB 2bit | |

10-1-2 Manual Mode

Under the “Manual Mode”, user needs to justify the validation of the touch event by continue polling the status of register. Generally, an enough times of continue accessing the activity of touch event from status register will be confirmed as a valid touch event. The method allows more flexibility and less mistake of justification for different application, but more MCU resource will be occupied.

TOLEN, OFFERS YOU THE BEST SERVICE AND HIGH QUALITY!!!

| Reg. | Bit_Num | Description |
|-------|----------|-----------------------------------|
| TPCR0 | Bit7 | Enable Touch Panel function |
| TPCR1 | Bit6 | “Manual-Mode=1” |

| TPYH | Bit[7:0] | Touch Panel COM dat MSB byte |
| TPXYL | Bit[3:2] | Touch Panel COM data LSB 2bit |
| | Bit[1:0] | Touch Panel SEG data LSB 2bit |

10-1-3 External Interrupt Mode

Under this mode LCM hardware interrupt pin(INT) must be connected correctly to the MCU interrupt input pin first. The major processes are listed as follows:

1. Enable Touch Panel function. (REG[70h]Bit7=1)。
2. Set operation mode for TP controller as Auto mode or Manual Mode(REG[71h]Bit6=1)。
3. Enable Touch Panel Interrupt.(REG[F0h]Bit6=1)。
4. When interrupt asserts,the IP jumps to the entry of ISR and check if TP interrupt。
5. If yes,according to the operation mode,doing the data latch for X,Y axis。
6. Process the corresponding jobs for the touch event。
7. Clear the interrupt status bit。

10-1-4 Software Polling Mode

Under the “Polling Mode”,no interrupt pin is needed for connection.The status of touch event can be read from 3 methods.Listed as follows:

1. From the status register(STSR)bit5. (REG[70h]Bit7=1)。
2. From TPXYL(REG[74h])bit7.
3. From the INTC2(REG[F1h])bit2.

10-1-5 Touch Panel Sampling Time Refernce Table

When using the auto mode of Touch Panel function,and the touch event occurring,LCM adapts a specific wait time for X,Y data stability.It is recommended to select a suitable T/P sampling time to avoid the mistake of ADC data latch.Please refer to the following table for the ADC sampling time.

| Touch Panel Sampling Time-REG[70h]Bit[6:4] | | | | | |

11. Design and Handling Precaution

1. The LCD panel is made by glass .Any mechanical shock will damage the LCD module.
2. Do not add excessive force on the surface of the display,which may cause the display color change Abnormally.
3. The polarizer on the LCD is easily get scratched.If possible,do not remove the LCD protective film Untile the last step of installation.
4. Never attempt to disassemble or rework the LCD module.
- 5.Only Clean the LCD with Isopropyl Alcohol or Ethy Alcohol.Other solvents may damage the LCD.
