DTV IF AGC AMPLIFIER

FEATURES

- SINGLE 3.3 V SUPPLY OPERATION
- Low DISTORTION: -55dBC@1VPP
- 14-68 dB TOTAL VOLTAGE GAIN
- 54 dB TOTAL GAIN CONTROL RANGE
- 10-100 MHz OPERATION

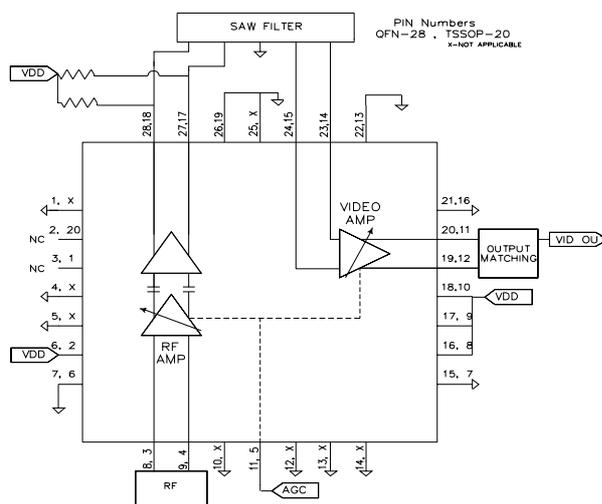

DESCRIPTION

The S510067 consists of an input Linear AGC amplifier and a video/AGC amplifier. The amplifiers are designed to interface directly with saw filters and A/D converters. The AGC is delayed between the two blocks for optimal NF and IM3 performance across the full AGC range. The final stage is capable of providing 2 VPP into a 500Ω load. The part is offered in the QFN28 & 20 TSSOP package and is RoHS compliant.

APPLICATIONS

- Digital Terrestrial Tuners • Digital TV Sets.
- Digital Radios • Digital Set top boxes.

TYPICAL PERFORMANCE CURVES

TYPICAL APPLICATION CIRCUIT

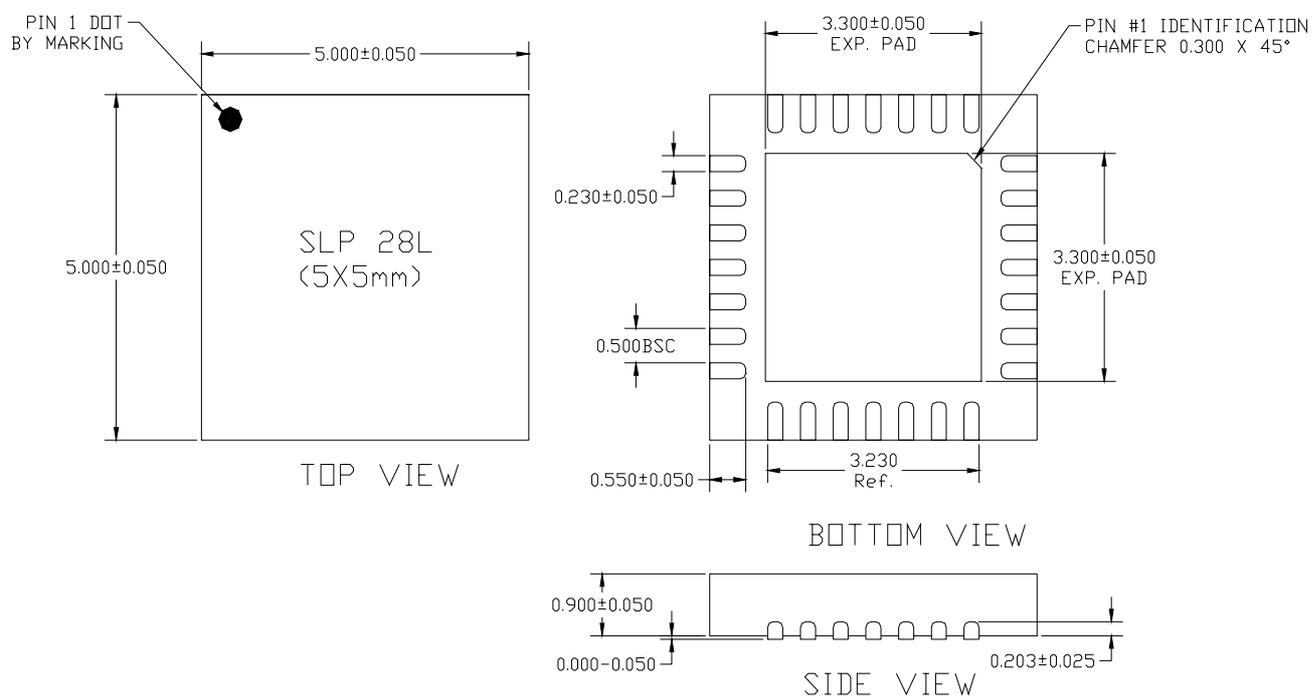

**Input Amplifier**

This amplifier provides a maximum gain of 39 dB. The gain is controlled by applying a DC voltage (from 0 to 3 V) to the AGC pin, providing 27 dB of range. The output stage current can be set between 10 mA ($R = 20$) and 30 mA ($R = 0$) by connecting an external resistor from pin 1 to ground.

Video Amplifier

This amplifier provides a maximum gain of 47 dB. The gain is controlled by applying a DC voltage (from 0 to 3 V) to the AGC pin, providing 27 dB of range. The outputs of the video amp are both open drain and require pull-up inductors to VDD. Up to 2 V_{PP} can be delivered into a 500 Ω load.

The input amplifier and video amplifier are controlled by a single AGC so the overall dynamic range is the sum of the input amplifier range and the video amplifier range.
