- JEDEC standard 1.35V(1.28V~1.45V) & 1.5V(1.425V~1.575V) Power Supply
- $V_{DDQ} = 1.35V(1.28V\sim 1.45V)$  & 1.5V(1.425V~1.575V)
- 400MHz  $f_{CK}$  for 800Mb/sec/pin, 533MHz  $f_{CK}$  for 1066Mb/sec/pin, 667MHz  $f_{CK}$  for 1333Mb/sec/pin
- 8 independent internal bank
- Programmable CAS Latency: 6,7,8,9
- Programmable Additive Latency(Posted CAS) : 0, CL - 2, or CL - 1 clock
- Programmable CAS Write Latency(CWL) = 5(DDR3-800), 6(DDR3-1066) and 7(DDR3-1333)
- 8-bit pre-fetch
- Burst Length: 8 (Interleave without any limit, sequential with starting address “000” only), 4 with tCCD = 4 which does not allow seamless read or write [either On the fly using A12 or MRS]
- Bi-directional Differential Data Strobe
- Internal(self) calibration : Internal self calibration through ZQ pin (RZQ : 240 ohm  $\pm$  1%)
- On Die Termination using ODT pin
- Average Refresh Period 7.8us at lower than  $T_{CASE} 85^{\circ}\text{C}$ , 3.9us at  $85^{\circ}\text{C} < T_{CASE} \leq 95^{\circ}\text{C}$
- Asynchronous Reset

## 7. Input/Output Functional Description

Symbol	Type	Polarity	Function
CK0	Input	Positive Edge	Positive line of the differential pair of system clock inputs that drives input to the on-DIMM Clock Driver.
<u>CK0</u>	Input	Negative Edge	Negative line of the differential pair of system clock inputs that drives the input to the on-DIMM Clock Driver.
CKE[1:0]	Input	Active High	CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers of the SDRAMs. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER DOWN (row ACTIVE in any bank)
<u>S</u> [3:0]	Input	Active Low	Enables the associated SDRAM command decoder when low and disables decoder when high. When decoder is disabled, new commands are ignored and previous operations continue. These input signals also disable all outputs (except CKE and ODT) of the register(s) on the DIMM when both inputs are high. When both S[1:0] are high, all register outputs (except CKE, ODT and Chip select) remain in the previous state. For modules supporting 4 ranks, S[3:2] operate similarly to S[1:0] for a second set of register outputs.
ODT[1:0]	Input	Active High	On-Die Termination control signals
<u>RAS</u> , <u>CAS</u> , <u>WE</u>	Input	Active Low	When sampled at the positive rising edge of the clock, CAS, RAS, and WE define the operation to be executed by the SDRAM.
V <sub>REFDQ</sub>	Supply		Reference voltage for DQ0-DQ63 and CB0-CB7
V <sub>REFCA</sub>	Supply		Reference voltage for A0-A15, BA0-BA2, <u>RAS</u> , <u>CAS</u> , <u>WE</u> , <u>S0</u> , <u>S1</u> , CKE0, CKE1, Par_In, ODT0 and ODT1.
BA[2:0]	Input		Selects which SDRAM bank of eight is activated. BA0 - BA2 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines mode register is to be accessed during an MRS cycle.
A[15:13, 12/BC,11, 10/AP,9:0]	Input		Provided the row address for Active commands and the column address and Auto Precharge bit for Read/Write commands to select one location out of the memory array in the respective bank. A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA. A12 is also utilized for BL 4/8 identification for "BL on the fly" during CAS command. The address inputs also provide the op-code during Mode Register Set commands.
DQ[63:0], CB[7:0]	I/O		Data and Check Bit Input/Output pins
DM[8:0]			Active High Masks write data when high, issued concurrently with input data. V <sub>DD</sub> , V <sub>SS</sub> Supply Power and ground for the DDR SDRAM input buffers and core logic. V <sub>TT</sub> Supply Termination Voltage for Address/Command/Control/Clock nets.
DQS[17:0]	I/O		Positive Edge Positive line of the differential data strobe for input and output data.
DQS[17:0]	I/O		Negative Edge Negative line of the differential data strobe for input and output data.
<u>TDQS</u> [17:9], <u>TDQS</u> [17:9]	OUT		TDQS/TDQS is applicable for X8 DRAMs only. When enabled via Mode Register A11=1 in MR1, DRAM will enable the same termination resistance function on TDQS/TDQS that is applied to DQS/DQS. When disabled via mode register A11=0 in MR1, DM/TDQS will provide the data mask function and TDQS is not used. X4/X16 DRAMs must disable the TDQS function via mode register A11=0 in MR1
SA[2:0]	IN		These signals are tied at the system planar to either V <sub>SS</sub> or V <sub>DDSPD</sub> to configure the serial SPD EEPROM address range.
SDA	I/O		This bidirectional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to V <sub>DDSPD</sub> on the system planar to act as a pull-up.
SCL	IN		This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus line to V <sub>DDSPD</sub> on the system planar to act as a pull-up.
<u>EVENT</u>	OUT (open drain)	Active Low	This signal indicates that a thermal event has been detected in the thermal sensing device. The system should guarantee the electrical level requirement is met for the EVENT pin on TS/SPD part.
V <sub>DDSPD</sub>	Supply		Serial EEPROM positive power supply wired to a separate power pin at the connector which supports from 3.0 Volt to 3.6 Volt (nominal 3.3V) operation.
<u>RESET</u>	IN		The RESET pin is connected to the RESET pin on the register and to the RESET pin on the DRAM. When low, all register outputs will be driven low and the Clock Driver clocks to the DRAMs and register(s) will be set to low level (the Clock Driver will remain synchronized with the input clock)
Par_In	IN		Parity bit for the Address and Control bus. ("1" : Odd, "0" : Even)
<u>Err_Out</u>	OUT (open drain)		Parity error detected on the Address and Control bus. A resistor may be connected from Err_Out bus line to V <sub>DD</sub> on the system planar to act as a pull up.
TEST			Used by memory bus analysis tools (unused (NC) on memory DIMMs)

## 8. Pinout Comparison Based On Module Type

## 11. Absolute Maximum Ratings

### 11.1 Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	NOTE
$V_{DD}$	Voltage on $V_{DD}$ pin relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1, 3
$V_{DDQ}$	Voltage on $V_{DDQ}$ pin relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1, 3
$V_{IN}, V_{OUT}$	Voltage on any pin relative to $V_{SS}$	-0.4 V ~ 1.975 V	V	1
$T_{STG}$	Storage Temperature	-55 to +100	°C	1, 2

**NOTE :**

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JEDEC document JESD51-2 standard.
3.  $V_{DD}$  and  $V_{DDQ}$  must be within 300mV of each other at all times; and  $V_{REF}$  must be not greater than  $0.6 \times V_{DDQ}$ . When  $V_{DD}$  and  $V_{DDQ}$  are less than 500mV;  $V_{REF}$  may be equal to or less than 300mV.

### 11.2 DRAM Component Operating Temperature Range

Symbol	Parameter	rating	Unit	NOTE
$T_{OPER}$	Operating Temperature Range	0 to 95	°C	1, 2, 3

**NOTE :**

1. Operating Temperature  $T_{OPER}$  is the case surface temperature on the center/top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0-85°C under all operating conditions
3. Some applications require operation of the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
  - a) Refresh commands must be doubled in frequency, therefore reducing the refresh interval tREFI to 3.9us. It is also possible to specify a component with 1X refresh (tREFI to 7.8us) in the Extended Temperature Range.
  - b) If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b)

## 12. AC & DC Operating Conditions

### 12.1 Recommended DC Operating Conditions (SSTL-15)

Symbol	Parameter	Operation Voltage	Rating			Units	NOTE
			Min.	Typ.	Max.		
$V_{DD}$	Supply Voltage	1.35V	1.2825	1.35	1.4500	V	1, 2, 3
		1.5V	1.425	1.5	1.575	V	1, 2, 3
$V_{DDQ}$	Supply Voltage for Output	1.35V	1.2825	1.35	1.4500	V	1, 2, 3
		1.5V	1.425	1.5	1.575	V	1, 2, 3

**NOTE:**

1. Under all conditions  $V_{DDQ}$  must be less than or equal to  $V_{DD}$ .
2.  $V_{DDQ}$  tracks with  $V_{DD}$ . AC parameters are measured with  $V_{DD}$  and  $V_{DDQ}$  tied together.
3.  $V_{DD}$  &  $V_{DDQ}$  rating are determined by operation voltage.

5. Single ended swing requirement for DQS -  $\overline{DQS}$  is 350mV (peak to peak). Differential swing requirement for DQS -  $\overline{DQS}$  is 700mV (peak to peak).

## 13.2 $V_{REF}$ Tolerances

The dc-tolerance limits and ac-noise limits for the reference voltages  $V_{REFCA}$  and  $V_{REFDQ}$  are illustrated in Figure 1. It shows a valid reference voltage  $V_{REF}(t)$  as a function of time. ( $V_{REF}$  stands for  $V_{REFCA}$  and  $V_{REFDQ}$  likewise).

$V_{REF}(DC)$  is the linear average of  $V_{REF}(t)$  over a very long period of time (e.g. 1 sec). This average has to meet the min/max requirements of  $V_{REF}$ . Furthermore  $V_{REF}(t)$  may temporarily deviate from  $V_{REF}(DC)$  by no more than  $\pm 1\% V_{DD}$ .

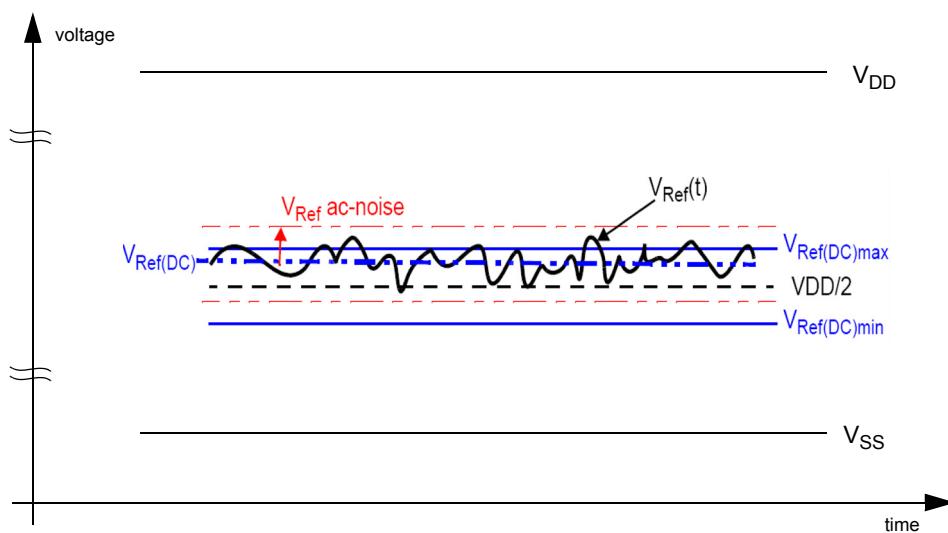

Figure 1. Illustration of  $V_{REF}(DC)$  tolerance and  $V_{REF}$  ac-noise limits

The voltage levels for setup and hold time measurements  $V_{IH}(AC)$ ,  $V_{IH}(DC)$ ,  $V_{IL}(AC)$  and  $V_{IL}(DC)$  are dependent on  $V_{REF}$ .

" $V_{REF}$ " shall be understood as  $V_{REF}(DC)$ , as defined in Figure 1.

This clarifies, that dc-variations of  $V_{REF}$  affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for  $V_{REF}(DC)$  deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with  $V_{REF}$  ac-noise. Timing and voltage effects due to ac-noise on  $V_{REF}$  up to the specified limit ( $\pm 1\% V_{DD}$ ) are included in DRAM timings and their associated deratings.

### 13.3 AC and DC Logic Input Levels for Differential Signals

#### 13.3.1 Differential Signals Definition

$V_{IL\text{diff}}(\text{AC})$	differential input low ac	NOTE 3	$2 \times (V_{REF} - V_{IL}(\text{AC}))$	V	2

NOTE :

1. Used to define a differential signal slew-rate.
2. for CK - CK use  $V_{IH}/V_{IL}(\text{AC})$  of ADD/CMD and  $V_{REFCA}$ ; for DQS - DQS̄, DQSL - DQSL̄, DQSU - DQSŪ use  $V_{IH}/V_{IL}(\text{AC})$  of DQs and  $V_{REFDQ}$ ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
3. These values are not defined, however they single-ended signals CK, CK̄, DQS, DQS̄, DQSL, DQSL̄, DQSU, DQSŪ need to be within the respective limits ( $V_{IH}(\text{DC})$  max,  $V_{IL}(\text{DC})$  min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "overshoot and Undershoot Specification"

### 13.3.3 Single-ended Requirements for Differential Signals

Each individual component of a differential signal (CK, DQS, DQSL, DQSU,  $\overline{CK}$ ,  $\overline{DQS}$ ,  $\overline{DQSL}$ , or  $\overline{DQSU}$ ) has also to comply with certain requirements for single-ended signals.

$CK$  and  $\overline{CK}$  have to approximately reach  $V_{SEH\min}$  /  $V_{SEL\max}$  (approximately equal to the ac-levels ( $V_{IH}(AC)$  /  $V_{IL}(AC)$ ) for ADD/CMD signals) in every half-cycle.

$DQS$ ,  $DQSL$ ,  $DQSU$ ,  $\overline{DQS}$ ,  $\overline{DQSL}$  have to reach  $V_{SEH\min}$  /  $V_{SEL\max}$  (approximately the ac-levels ( $V_{IH}(AC)$  /  $V_{IL}(AC)$ ) for DQ signals) in every half-cycle proceeding and following a valid transition.

Note that the applicable ac-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g. if  $V_{IH}150(AC)/V_{IL}150(AC)$  is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals  $CK$  and  $\overline{CK}$ .

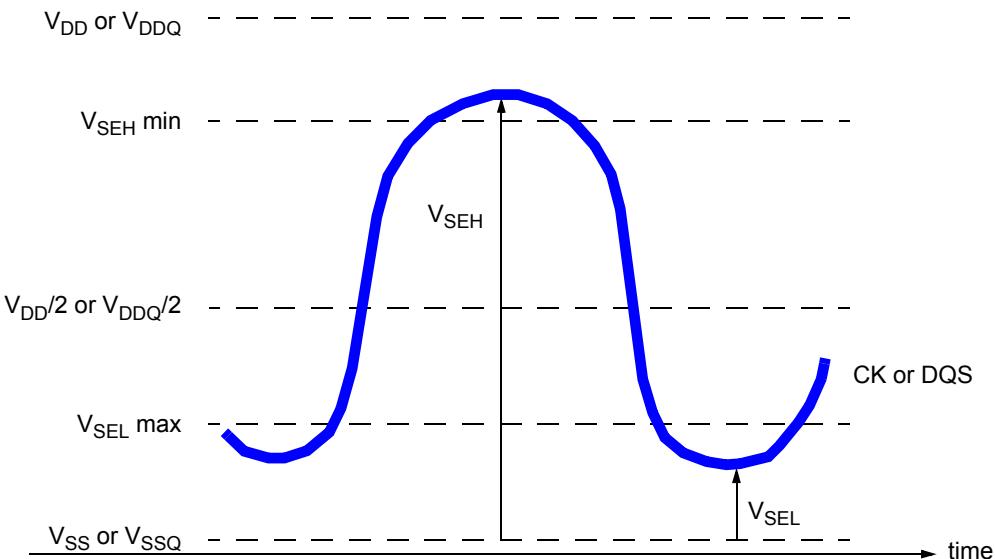

Figure 3. Single-ended requirement for differential signals

Note that while ADD/CMD and DQ signal requirements are with respect to  $V_{REF}$ , the single-ended components of differential signals have a requirement with respect to  $V_{DD}/2$ ; this is nominally the same. The transition of single-ended signals through the ac-levels is used to measure setup time. For single-ended components of differential signals the requirement to reach  $V_{SEL\max}$ ,  $V_{SEH\min}$  has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

[ Table 5 ] Single ended levels for CK, DQS, DQSL, DQSU,  $\overline{CK}$ ,  $\overline{DQS}$ ,  $\overline{DQSL}$  or  $\overline{DQSU}$

Symbol	Parameter	DDR3-800/1066/1333/1600		Unit	NOTE
		Min	Max		
$V_{SEH}$	Single-ended high-level for strobes	$(V_{DD}/2)+0.175$	NOTE 3	V	1, 2
	Single-ended high-level for CK, $\overline{CK}$	$(V_{DD}/2)+0.175$	NOTE 3	V	1, 2
$V_{SEL}$	Single-ended low-level for strobes	NOTE 3	$(V_{DD}/2)-0.175$	V	1, 2
	Single-ended low-level for CK, $\overline{CK}$	NOTE 3	$(V_{DD}/2)-0.175$	V	1, 2

NOTE :

- For  $CK$ ,  $\overline{CK}$  use  $V_{IH}/V_{IL}(AC)$  of ADD/CMD; for strobes ( $DQS$ ,  $\overline{DQS}$ ,  $DQSL$ ,  $\overline{DQSL}$ ,  $DQSU$ ,  $\overline{DQSU}$ ) use  $V_{IH}/V_{IL}(AC)$  of DQs.
- $V_{IH}(AC)/V_{IL}(AC)$  for DQs is based on  $V_{REFDQ}$ ;  $V_{IH}(AC)/V_{IL}(AC)$  for ADD/CMD is based on  $V_{REFCA}$ ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here
- These values are not defined, however the single-ended signals  $CK$ ,  $\overline{CK}$ ,  $DQS$ ,  $\overline{DQS}$ ,  $DQSL$ ,  $\overline{DQSL}$ ,  $DQSU$ ,  $\overline{DQSU}$  need to be within the respective limits ( $V_{IH}(DC)$  max,  $V_{IL}(DC)$  min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specification"

### 13.3.4 Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK,  $\overline{CK}$  and DQS,  $\overline{DQS}$ ) must meet the requirements in below table. The differential input cross point voltage  $V_{IX}$  is measured from the actual cross point of true and complement signal to the mid level between of  $V_{DD}$  and  $V_{SS}$ .

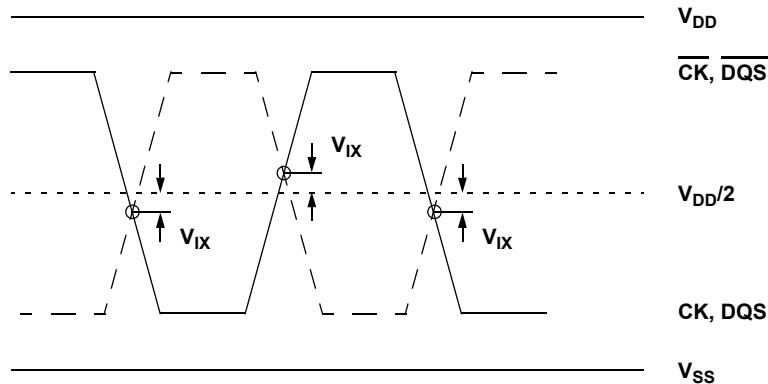

Figure 4.  $V_{IX}$  Definition

[ Table 6 ] Cross point voltage for differential input signals (CK, DQS)

Symbol	Parameter	DDR3-800/1066/1333/1600		Unit	NOTE
		Min	Max		
$V_{IX}$	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for CK, $\overline{CK}$	-150	150	mV	
		-175	175	mV	1
$V_{IX}$	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS, $\overline{DQS}$	-150	150	mV	

**NOTE :**

1. Extended range for  $V_{IX}$  is only allowed for clock and if single-ended clock input signals CK and  $\overline{CK}$  are monotonic, have a single-ended swing  $V_{SEL} / V_{SEH}$  of at least  $V_{DD}/2 \pm 250$  mV, and the differential slew rate of CK- $\overline{CK}$  is larger than 3 V/ ns.

### 13.4 Slew Rate Definition for Single Ended Input Signals

See "Address / Command Setup, Hold and Derating" for single-ended slew rate definitions for address and command signals.

See "Data Setup, Hold and Slew Rate Derating" for single-ended slew rate definitions for data signals.

### 13.5 Slew rate definition for Differential Input Signals

Input slew rate for differential signals (CK,  $\overline{CK}$  and DQS,  $\overline{DQS}$ ) are defined and measured as shown in below.

[ Table 7 ] Differential input slew rate definition

Description	Measured		Defined by
	From	To	
Differential input slew rate for rising edge (CK- $\overline{CK}$ and DQS- $\overline{DQS}$ )	$V_{ILdiffmax}$	$V_{IHdiffmin}$	$\frac{V_{IHdiffmin} - V_{ILdiffmax}}{\Delta TRdiff}$
Differential input slew rate for falling edge (CK- $\overline{CK}$ and DQS- $\overline{DQS}$ )	$V_{IHdiffmin}$	$V_{ILdiffmax}$	$\frac{V_{IHdiffmin} - V_{ILdiffmax}}{\Delta TFdiff}$

**NOTE :** The differential signal (i.e. CK -  $\overline{CK}$  and DQS -  $\overline{DQS}$ ) must be linear between these thresholds

## 14. AC & DC Output Measurement Levels

### 14.1 Single Ended AC and DC Output Levels

[Table 8] Single Ended AC and DC output levels

Symbol	Parameter	DDR3-800/1066/1333/1600	Units	NOTE
$V_{OH}(DC)$	DC output high measurement level (for IV curve linearity)	$0.8 \times V_{DDQ}$	V	
$V_{OM}(DC)$	DC output mid measurement level (for IV curve linearity)	$0.5 \times V_{DDQ}$	V	
$V_{OL}(DC)$	DC output low measurement level (for IV curve linearity)	$0.2 \times V_{DDQ}$	V	
$V_{OH}(AC)$	AC output high measurement level (for output SR)	$V_{TT} + 0.1 \times V_{DDQ}$	V	1
$V_{OL}(AC)$	AC output low measurement level (for output SR)	$V_{TT} - 0.1 \times V_{DDQ}$	V	1

NOTE : 1. The swing of  $+/-0.1 \times V_{DDQ}$  is based on approximately 50% of the static single ended output high or low swing with a driver impedance of  $40\Omega$  and an effective test load of  $25\Omega$  to  $V_{TT}=V_{DDQ}/2$ .

### 14.2 Differential AC and DC Output Levels

[Table 9] Differential AC and DC output levels

Symbol	Parameter	DDR3-800/1066/1333/1600	Units	NOTE
$V_{OHdiff}(AC)$	AC differential output high measurement level (for output SR)	$+0.2 \times V_{DDQ}$	V	1
$V_{OLdiff}(AC)$	AC differential output low measurement level (for output SR)	$-0.2 \times V_{DDQ}$	V	1

NOTE : 1. The swing of  $+/-0.2 \times V_{DDQ}$  is based on approximately 50% of the static single ended output high or low swing with a driver impedance of  $40\Omega$  and an effective test load of  $25\Omega$  to  $V_{TT}=V_{DDQ}/2$  at each of the differential outputs.

### 14.3 Single-ended Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between  $V_{OL}(AC)$  and  $V_{OH}(AC)$  for single ended signals as shown in below.

[Table 10] Single ended Output slew rate definition

Description	Measured		Defined by
	From	To	
Single ended output slew rate for rising edge	$V_{OL}(AC)$	$V_{OH}(AC)$	$\frac{V_{OH}(AC)-V_{OL}(AC)}{\Delta T_{Rse}}$
Single ended output slew rate for falling edge	$V_{OH}(AC)$	$V_{OL}(AC)$	$\frac{V_{OH}(AC)-V_{OL}(AC)}{\Delta T_{Fse}}$

NOTE : Output slew rate is verified by design and characterization, and may not be subject to production test.

[Table 11] Single ended output slew rate

Parameter	Symbol	Operation Voltage	DDR3-800		DDR3-1066		DDR3-1333		DDR3-1600		Units
			Min	Max	Min	Max	Min	Max	Min	Max	
Single ended output slew rate	SRQse	1.35V	1.75	5 <sup>1)</sup>	1.75	5 <sup>1)</sup>	-	-	TBD	TBD	V/ns
		1.5V	2.5	5	2.5	5	2.5	5	TBD	5	V/ns

Description : SR : Slew Rate

Q : Query Output (like in DQ, which stands for Data-in, Query-Output)

se : Single-ended Signals, For Ron = RZQ/7 setting

NOTE : 1) In two cased, a maximum slew rate of 6V/ns applies for a single DQ signal within a byte lane.

- Case\_1 is defined for a single DQ signal within a byte lane which is switching into a certain direction (either from high to low or low to high) while all remaining DQ signals in the same byte lane are static (i.e they stay at either high or low).
- Case\_2 is defined for a single DQ signals in the same byte lane are switching into the opposite direction (i.e. from low to high or high to low respectively). For the remaining DQ signal switching into the opposite direction, the regular maximum limit of 5 V/ns applies.

## 14.4 Differential Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between  $V_{OLdiff}(AC)$  and  $V_{OHdiff}(AC)$  for differential signals as shown in below.

[ Table 12 ] Differential Output slew rate definition

Description	Measured		Defined by
	From	To	
Differential output slew rate for rising edge	$V_{OLdiff}(AC)$	$V_{OHdiff}(AC)$	$\frac{V_{OHdiff}(AC)-V_{OLdiff}(AC)}{\Delta T Rdiff}$
Differential output slew rate for falling edge	$V_{OHdiff}(AC)$	$V_{OLdiff}(AC)$	$\frac{V_{OHdiff}(AC)-V_{OLdiff}(AC)}{\Delta T Fdiff}$

NOTE : Output slew rate is verified by design and characterization, and may not be subject to production test.

### 18.3.1 Speed Bin Table Notes

Absolute Specification [ $T_{OPER}$ :  $V_{DDQ} = V_{DD} = 1.35V(1.28V\sim1.45V)$  &  $1.5V(1.425V\sim1.575V)$ ];

**NOTE :**

1. The CL setting and CWL setting result in tCK(AVG).MIN and tCK(AVG).MAX requirements. When making a selection of tCK(AVG), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. tCK(AVG).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(AVG) value (2.5, 1.875, 1.5, or 1.25 ns) when calculating CL [nCK] = tAA [ns] / tCK(AVG) [ns], rounding up to the next "SupportedCL".
3. tCK(AVG).MAX limits: Calculate  $tCK(AVG) = tAA.MAX / CL \text{ SELECTED}$  and round the resulting tCK(AVG) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is tCK(AVG).MAX corresponding to CL SELECTED.
4. "Reserved" settings are not allowed. User must program a different value.
5. "Optional" settings allow certain devices in the industry to support this setting, however, it is not a mandatory feature. Refer to supplier's data sheet and/or the DIMM SPD information if and how this setting is supported.
6. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/ Characterization.
7. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/ Characterization.
8. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/ Characterization.
9. For devices supporting optional downshift to CL=7 and CL=9, tAA/tRCD/tRP min must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1333(CL9) devices supporting downshift to DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600(CL11) devices supporting downshift to DDR3-1333(CL9) or DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accordingly. For example, 49.125ns (tRASmin + tRPmin=36ns+13.125ns) for DDR3-1333(CL9) and 48.125ns (tRASmin+tRPmin=35ns+13.125ns) for DDR3-1600(CL11).

## 19.1 Jitter Notes

- Specific Note a** Unit 'tCK(avg)' represents the actual tCK(avg) of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges. $tMRD = 4 [nCK]$  means; if one Mode Register Set command is registered at Tm, another Mode Register Set command may be registered at Tm+4, even if  $(Tm+4 - Tm)$  is  $4 \times tCK(\text{avg}) + tERR(4\text{per}),\text{min}$ .
- Specific Note b** These parameters are measured from a command/address signal (CKE,  $\overline{\text{CS}}$ ,  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$ ,  $\overline{\text{WE}}$ , ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal ( $\overline{\text{CK}}$ / $\text{CK}$ ) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note c** These parameters are measured from a data strobe signal (DQS(L/U),  $\overline{\text{DQS}}(\text{L/U})$ ) crossing to its respective clock signal (CK,  $\overline{\text{CK}}$ ) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note d** These parameters are measured from a data signal (DM(L/U), DQ(L/U)0, DQ(L/U)1, etc.) transition edge to its respective data strobe signal (DQS(L/U),  $\overline{\text{DQS}}(\text{L/U})$ ) crossing.
- Specific Note e** For these parameters, the DDR3 SDRAM device supports  $t_{PARAM} [\text{nCK}] = RU\{ t_{PARAM} [\text{ns}] / tCK(\text{avg}) [\text{ns}] \}$ , which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support  $t_{RP} = RU\{t_{RP} / tCK(\text{avg})\}$ , which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which  $t_{RP} = 15\text{ns}$ , the device will support  $t_{RP} = RU\{t_{RP} / tCK(\text{avg})\} = 6$ , as long as the input clock jitter specifications are met, i.e. Precharge command at Tm and Active command at Tm+6 is valid even if  $(Tm+6 - Tm)$  is less than  $15\text{ns}$  due to input clock jitter.
- Specific Note f** When the device is operated with input clock jitter, this parameter needs to be derated by the actual tERR(mper),act of the input clock, where  $2 \leq m \leq 12$ . (output deratings are relative to the SDRAM input clock.)  
For example, if the measured jitter into a DDR3-800 SDRAM has  $tERR(\text{mper}),\text{act,min} = -172\text{ ps}$  and  $tERR(\text{mper}),\text{act,max} = +193\text{ ps}$ , then  $tDQSCK,\text{min}(\text{derated}) = tDQSCK,\text{min} - tERR(\text{mper}),\text{act,max} = -400\text{ ps} - 193\text{ ps} = -593\text{ ps}$  and  $tDQSCK,\text{max}(\text{derated}) = tDQSCK,\text{max} - tERR(\text{mper}),\text{act,min} = 400\text{ ps} + 172\text{ ps} = +572\text{ ps}$ . Similarly,  $tLZ(DQ)$  for DDR3-800 derates to  $tLZ(DQ),\text{min}(\text{derated}) = -800\text{ ps} - 193\text{ ps} = -993\text{ ps}$  and  $tLZ(DQ),\text{max}(\text{derated}) = 400\text{ ps} + 172\text{ ps} = +572\text{ ps}$ . (Caution on the min/max usage!)  
Note that  $tERR(\text{mper}),\text{act,min}$  is the minimum measured value of  $tERR(n\text{per})$  where  $2 \leq n \leq 12$ , and  $tERR(\text{mper}),\text{act,max}$  is the maximum measured value of  $tERR(n\text{per})$  where  $2 \leq n \leq 12$ .
- Specific Note g** When the device is operated with input clock jitter, this parameter needs to be derated by the actual tJIT(per),act of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR3-800 SDRAM has  $tCK(\text{avg}),\text{act} = 2500\text{ ps}$ ,  $tJIT(\text{per}),\text{act,min} = -72\text{ ps}$  and  $tJIT(\text{per}),\text{act,max} = +93\text{ ps}$ , then  $tRP,\text{min}(\text{derated}) = tRP,\text{min} + tJIT(\text{per}),\text{act,min} = 0.9 \times tCK(\text{avg}),\text{act} + tJIT(\text{per}),\text{act,min} = 0.9 \times 2500\text{ ps} - 72\text{ ps} = +2178\text{ ps}$ . Similarly,  $tQH,\text{min}(\text{derated}) = tQH,\text{min} + tJIT(\text{per}),\text{act,min} = 0.38 \times tCK(\text{avg}),\text{act} + tJIT(\text{per}),\text{act,min} = 0.38 \times 2500\text{ ps} - 72\text{ ps} = +878\text{ ps}$ . (Caution on the min/max usage!)

## 19.2 Timing Parameter Notes

1. Actual value dependant upon measurement level definitions which are TBD.
2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
3. The max values are system dependent.
4. WR as programmed in mode register
5. Value must be rounded-up to next higher integer value
6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, tREFI.
7. For definition of RTT turn-on time tAON see "Device Operation & Timing Diagram Datasheet"
8. For definition of RTT turn-off time tAOF see "Device Operation & Timing Diagram Datasheet".
9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.
10. WR in clock cycles as programmed in MRO
11. The maximum read postamble is bound by tDQSK(min) plus tQSH(min) on the left side and tHZ(DQS)max on the right side. See "Device Operation & Timing Diagram Datasheet".
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD
13. Value is only valid for RON34
14. Single ended signal parameter. Refer to chapter 8 and chapter 9 for definition and measurement method.
15. tREFI depends on T<sub>OPER</sub>
16. tIS(base) and tIH(base) values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, CK differential slew rate. Note for DQ and DM signals, V<sub>REF</sub>(DC) = V<sub>REF</sub>DQ(DC). For input only pins except RESET, V<sub>REF</sub>(DC)=V<sub>REF</sub>CA(DC). See ?\$paratext? on page 48. .
17. tDS(base) and tDH(base) values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, DQS differential slew rate. Note for DQ and DM signals, V<sub>REF</sub>(DC)= V<sub>REF</sub>DQ(DC). For input only pins except RESET, V<sub>REF</sub>(DC)=V<sub>REF</sub>CA(DC). See ?\$paratext? on page 54.
18. Start of internal write transaction is defined as follows ;
  - For BL8 (fixed by MRS and on-the-fly) : Rising clock edge 4 clock cycles after WL.
  - For BC4 (on-the-fly) : Rising clock edge 4 clock cycles after WL
  - For BC4 (fixed by MRS) : Rising clock edge 2 clock cycles after WL
19. The maximum read preamble is bound by tLZDQS(min) on the left side and tDQSK(max) on the right side. See "Device Operation & Timing Diagram Datasheet"
20. CKE is allowed to be registered low while operations such as row activation, precharge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
21. Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXPDL(min) is also required. See "Device Operation & Timing Diagram Datasheet".
22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
23. One ZQCS command can effectively correct a minimum of 0.5 % (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other application specific parameters.  
One method for calculating the interval between ZQCS commands, given the temperature (Tdriftrate) and voltage (Vdriftrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$\text{ZQCorrection} \\ \frac{0.5}{(\text{TSens} \times \text{Tdriftrate}) + (\text{VSens} \times \text{Vdriftrate})}$$

where TSens = max(dRTTdT, dRONdT) and VSens = max(dRTTdV, dRONdV) define the SDRAM temperature and voltage sensitivities.

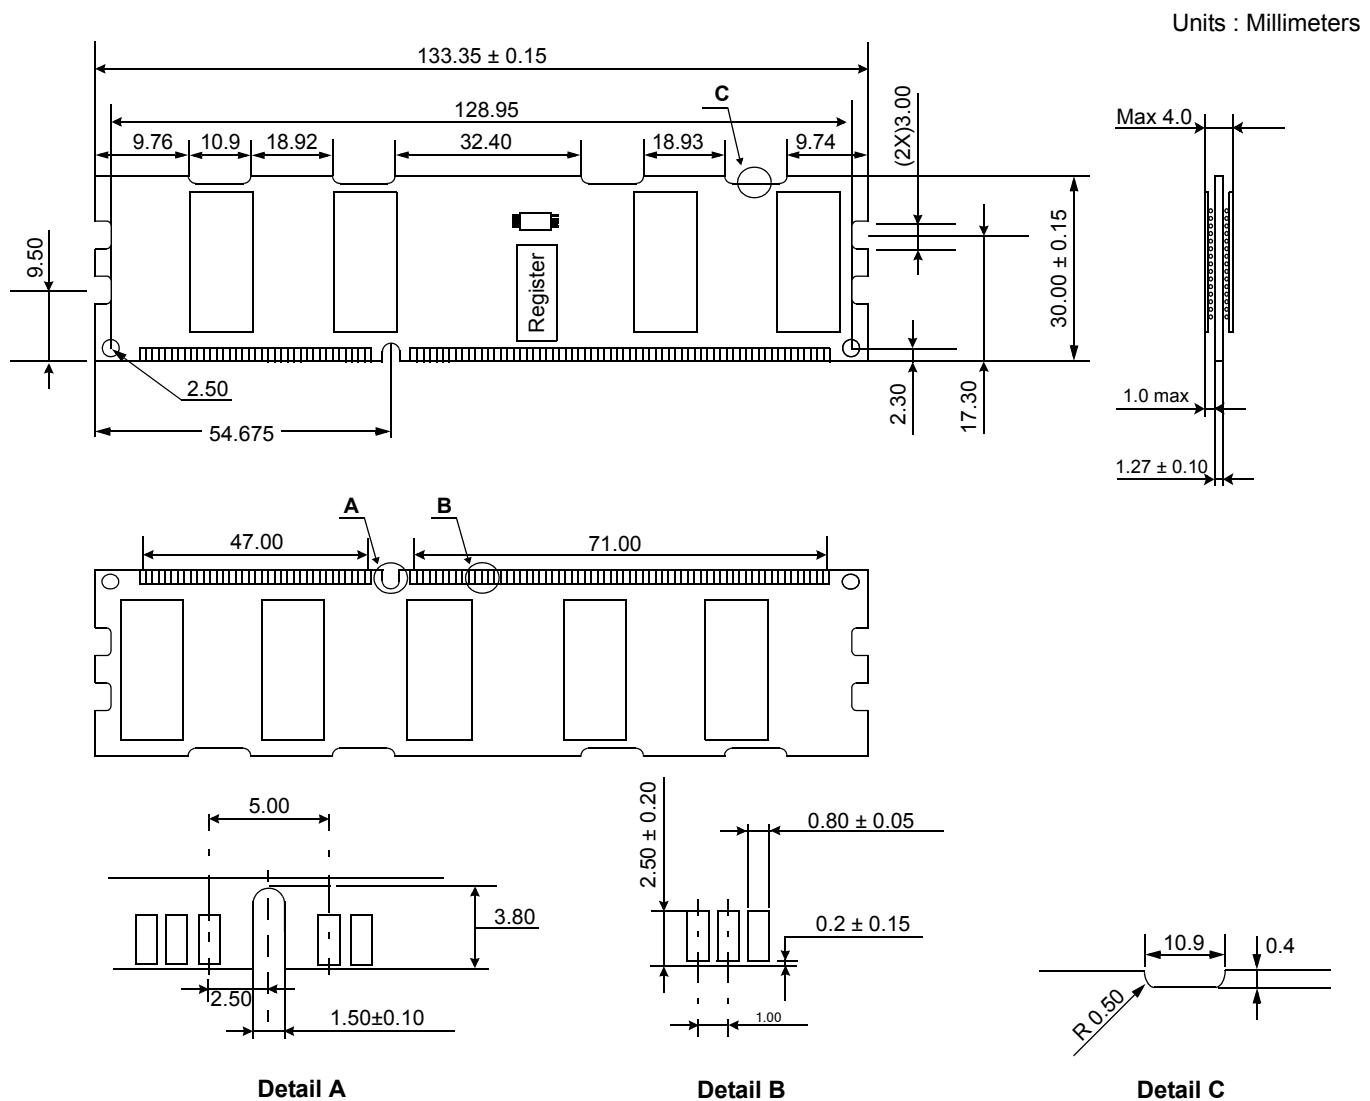

For example, if TSens = 1.5% /°C, VSens = 0.15% / mV, Tdriftrate = 1°C / sec and Vdriftrate = 15 mV / sec, then the interval between ZQCS commands is calculated as:

$$\frac{0.5}{(1.5 \times 1) + (0.15 \times 15)} = 0.133 \approx 128\text{ms}$$

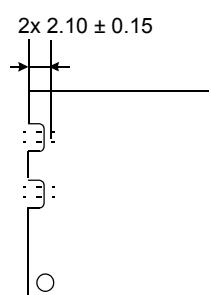

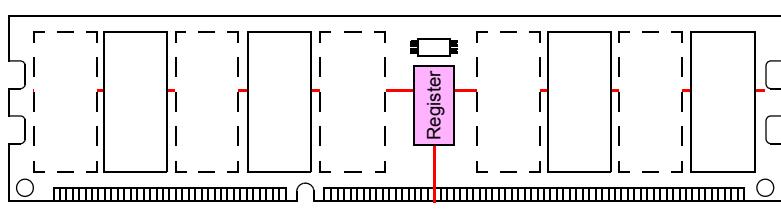

24. n = from 13 cycles to 50 cycles. This row defines 38 parameters.
25. tCH(abs) is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
26. tCL(abs) is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.
27. The tIS(base) AC150 specifications are adjusted from the tIS(base) specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150 mV and another 25 ps to account for the earlier reference point [(175 mV - 150 mV) / 1 V/ns].
28. Pulse width of a input signal is defined as the width between the first crossing of V<sub>REF</sub>(DC) and the consecutive crossing of V<sub>REF</sub>(DC)
29. tDQLS describes the instantaneous differential input low pulse width on DQS-DQS, as measured from one falling edge to the next consecutive rising edge.
30. tDQSH describes the instantaneous differential input high pulse width on DQS-DQS, as measured from one rising edge to the next consecutive falling edge.
31. tDQSH, act + tDQLS, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.
32. tDSH, act + tDSS, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.
