**Notes on Ratings and Characteristics**

1.0 Voltage Grade Table

Voltage Grade	V <sub>RRM</sub> (V)	V <sub>RSM</sub> (V)	V <sub>R</sub> dc (V)
14	1400	1500	930
16	1600	1700	1040
18	1800	1900	1150
20	2000	2100	1250
21	2100	2200	1300

2.0 De-rating Factor

A blocking voltage de-rating factor of 0.13% per °C is applicable to this device for T<sub>j</sub> below 25°C.

3.0 ABCD Constants

These constants (applicable only over current range of V<sub>F</sub> characteristic in Figure 1) are the coefficients of the expression for the forward characteristic given below:

$$V_F = A + B \cdot \ln(I_F) + C \cdot I_F + D \cdot \sqrt{I_F}$$

where I<sub>F</sub> = instantaneous forward current.

4.0 Reverse recovery ratings

(i) Q<sub>ra</sub> is based on 50% I<sub>rm</sub> chord as shown in Fig.(a) below.

(ii) Q<sub>rr</sub> is based on a 150µs integration time.

i.e. 
$$Q_{rr} = \int_0^{150\mu s} i_{rr} \cdot dt$$

(iii) 
$$K \text{ Factor} = \frac{t_1}{t_2}$$

### 5.0 Reverse Recovery Loss

The following procedure is recommended for use where it is necessary to include reverse recovery loss.

From waveforms of recovery current obtained from a high frequency shunt (see Note 1) and reverse voltage present during recovery, an instantaneous reverse recovery loss waveform must be constructed. Let the area under this waveform be  $E$  joules per pulse. A new sink temperature can then be evaluated from:

$$T_{SINK} = T_{j(MAX)} - E \cdot [k + f \cdot R_{thJK}]$$

Where  $k = 0.2314$  ( $^{\circ}\text{C}/\text{W}$ )/s

$E$  = Area under reverse loss waveform per pulse in joules (W.s.)

$f$  = Rated frequency in Hz at the original sink temperature.

$R_{th(JK)}$  = d.c. thermal resistance ( $^{\circ}\text{C}/\text{W}$ )

The total dissipation is now given by:

$$W_{(tot)} = W_{(original)} + E \cdot f$$

#### NOTE 1 - Reverse Recovery Loss by Measurement

This device has a low reverse recovered charge and peak reverse recovery current. When measuring the charge, care must be taken to ensure that:

(a) AC coupled devices such as current transformers are not affected by prior passage of high amplitude forward current.

(b) A suitable, polarised, clipping circuit must be connected to the input of the measuring oscilloscope to avoid overloading the internal amplifiers by the relatively high amplitude forward current signal.

(c) Measurement of reverse recovery waveform should be carried out with an appropriate critically damped snubber, connected across diode anode to cathode. The formula used for the calculation of this snubber is shown below:

$$R^2 = 4 \cdot \frac{V_r}{C_s \cdot di/dt}$$

Where:  $V_r$  = Commutating source voltage

$C_s$  = Snubber capacitance

$R$  = Snubber resistance

### 6.0 Snubber Components

When selecting snubber components, care must be taken not to use excessively large values of snubber capacitor or excessively small values of snubber resistor. Such excessive component values may lead to device damage due to the large resultant values of snubber discharge current. If required, please consult the factory for assistance.

## 7.0 Computer Modelling Parameters

### 7.1 Device Dissipation Calculations

$$I_{AV} = \frac{-V_o + \sqrt{V_o^2 + 4 \cdot ff^2 \cdot r_s \cdot W_{AV}}}{2 \cdot ff^2 \cdot r_s}$$

Where  $V_{T0} = 1.09V$ ,  $r_T = 0.34m\Omega$

$ff$  = form factor (normally unity for fast diode applications)

$$W_{AV} = \frac{\Delta T}{R_{th}}$$

$$\Delta T = T_{j(MAX)} - T_k$$

### 7.2 Calculation of $V_F$ using ABCD Coefficients

The forward characteristic  $I_F$  Vs  $V_F$ , on page 6 is represented in two ways;

- (i) the well established  $V_{T0}$  and  $r_T$  tangent used for rating purposes and
- (ii) a set of constants A, B, C, and D forming the coefficients of the representative equation for  $V_F$  in terms of  $I_F$  given below:

$$V_F = A + B \cdot \ln(I_F) + C \cdot I_F + D \cdot \sqrt{I_F}$$

The constants, derived by curve fitting software, are given in this report for both hot and cold characteristics. The resulting values for  $V_F$  agree with the true device characteristic over a current range, which is limited to that plotted.

25°C Coefficients		125°C Coefficients	
A	1.162077	A	1.087889
B	$5.895938 \times 10^{-3}$	B	$3.637731 \times 10^{-3}$
C	$3.14729 \times 10^{-4}$	C	$3.537834 \times 10^{-4}$
D	$-9.380176 \times 10^{-4}$	D	$1.10333 \times 10^{-3}$

## 8.0 Frequency Ratings

The curves illustrated in figures 8 to 16 are for guidance only and are superseded by the maximum ratings shown on page 1.

### 9.0 Square wave ratings

These ratings are given for load component rate of rise of forward current of 100 and 500 A/ $\mu$ s.

### 10.0 Duty cycle lines

The 100% duty cycle is represented on all the ratings by a straight line. Other duties can be included as parallel to the first.
