2.6 JTAG ID

JTAG ID register is a read-only register located inside the JTAG module, and is used to recognize the device(s) connected to the JTAG interface. Its content is shifted out when INSTRUCTION register contains the IDCODE command (opcode 04_H), and the same is also true immediately after reset.

The JTAG ID register contents for the XC822/824 Flash devices are given in [Table 4](#).

Table 4 JTAG ID Summary

Device Type	Device Name	JTAG ID
Flash	XC822/824*	101B C083 _H

Note: The asterisk () above denotes all possible device configurations.*

2.7 Chip Identification Number

The XC822/824 identity (ID) register is located at Page 1 of address B3_H. The value of ID register is 51_H. However, for easy identification of product variants, the Chip Identification Number, which is a unique number assigned to each product variant, is available. The differentiation is based on the product and variant type information.

Two methods are provided to read a device's Chip Identification number:

- In-application subroutine, GET_CHIP_INFO
- Boot-loader (BSL) mode A

Table 5 lists the Chip Identification numbers of XC822/824 device variants.

3 Electrical Parameters

Chapter 3 provides the characteristics of the electrical parameters which are implementation-specific for the XC822/824.

3.1 General Parameters

The general parameters are described here to aid the users in interpreting the parameters mainly in **Section 3.2** and **Section 3.3**.

3.1.1 Parameter Interpretation

The parameters listed in this section represent partly the characteristics of the XC822/824 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are indicated by the abbreviations in the "Symbol" column:

- **CC**
 - These parameters indicate **C**ontroller **C**haracteristics, which are distinctive features of the XC822/824 and must be regarded for a system design.
- **SR**
 - These parameters indicate **S**ystem **R**equirements, which must be provided by the microcontroller system in which the XC822/824 is designed in.

3.1.2 Absolute Maximum Rating

Maximum ratings are the extreme limits to which the XC822/824 can be subjected to without permanent damage.

Table 6 Absolute Maximum Rating Parameters

Parameter	Symbol	Limit Values		Unit	Notes
		Min.	Max.		
Ambient temperature	T_A	-40	125	°C	under bias
Storage temperature	T_{ST}	-65	150	°C	–
Junction temperature	T_J	-40	150	°C	under bias
Voltage on power supply pin with respect to V_{SS}	V_{DDP}	-0.5	6	V	
Input current on any pin during overload condition	I_{IN}	-10	10	mA	
Absolute sum of all input currents during overload condition	$\Sigma I_{IN} $	–	50	mA	

Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During absolute maximum rating overload conditions ($V_{IN} > V_{DDP}$ or $V_{IN} < V_{SS}$) the voltage on V_{DDP} pin with respect to ground (V_{SS}) must not exceed the values defined by the absolute maximum ratings.

3.1.3 Operating Condition

The following operating conditions must not be exceeded in order to ensure correct operation of the XC822/824. All parameters mentioned in the following tables refer to these operating conditions, unless otherwise noted.

Table 7 Operating Condition Parameters

		Min.	Max.		
Digital power supply voltage	V_{DDP}	3.0	5.5	V	
		2.5	3.0	V	¹⁾
CPU Clock Frequency	f_{CCLK}	22.5	25.6	MHz	typ. 24 MHz
		7.5	8.5	MHz	typ. 8 MHz

1) Not subjected to production test, verified by design/characterization. Hysteresis is implemented to avoid meta stable states and switching due to internal ground bounce. It cannot be guaranteed that it suppresses switching due to external system noise.

2) An additional error current (I_{INJ}) will flow if an overload current flows through an adjacent pin.

3) Not subjected to production test, verified by design/characterization.

4) Not subjected to production test, verified by design/characterization. However, for applications with strict low power-down current requirements, it is mandatory that no active voltage source is supplied at any GPIO pin when V_{DDP} is powered off.

3.2.2 Supply Threshold Characteristics

Table 9 provides the characteristics of the supply threshold in the XC822/824.

3.2.3 ADC Characteristics

The values in **Table 10** are given for an analog power supply of 5.0 V. The ADC can be used with an analog power supply down to 3 V. But in this case, analog parameters may show a reduced performances. In the reduced voltage mode ($2.5\text{ V} < V_{DDP} < 3\text{ V}$), the ADC is not recommended to be used.

3) Not subject to production test, verified by design/characterization.

4) If a reduced positive reference voltage is used, TUE will increase. If the positive reference is reduced by a factor of K, the TUE will increased by 1/K. Example:K = 0.8, 1/K = 1.25; 1.25 X TUE = 2.5 LSB10.

5) The sampling capacity of the conversion C-Network is pre-charged to $V_{AREF}/2$ before connecting the input to the C-Network. Because of the parasitic elements, the voltage measured at ANx is lower than $V_{AREF}/2$.

3.2.4 Flash Memory Parameters

The XC822/824 is delivered with all Flash sectors erased (read all zeros).

The data retention time of the XC822/824's Flash memory (i.e. the time after which stored data can still be retrieved) depends on the number of times the Flash memory has been erased and programmed.

Note: Flash memory parameters are not subject to production test but verified by design and/or characterization.

Read access time (per byte)	t_{ACC}	CC	–	125	–	ns	
Programming time (per wordline)	t_{PR}	CC	–	2.2	–	ms	
Erase time (one or more sectors)	t_{ER}	CC	–	120	–	ms	
Flash wait states	$N_{WSFLASH}$	CC	0				CPU clock = 8 MHz
			1				CPU clock = 24 MHz

Table 13 Flash Data Retention and Endurance (Operating Conditions apply)

Retention	Endurance ¹⁾	Size	Remarks

5 years	10,000 cycles	1 Kbyte	
2 years	70,000 cycles	512 bytes	
2 years	100,000 cycles	128 bytes	

1) One cycle refers to the programming of all wordlines in a sector and erasing of sector. The Flash endurance data specified in **Table 13** is valid only if the following conditions are fulfilled:

- the maximum number of erase cycles per Flash sector must not exceed 100,000 cycles.
- the maximum number of erase cycles per Flash bank must not exceed 300,000 cycles.
- the maximum number of program cycles per Flash bank must not exceed 2,500,000 cycles.

Electrical Parameters

Table 14 Emulated Flash Data Retention and Endurance based on EEPROM Emulation ROM Library (Operating Conditions apply)¹⁾

Retention	Endurance ²⁾	Emulation Size	Remarks
2 years	1,600,000 cycles	31 bytes	
2 years	1,400,000 cycles	62 bytes	
2 years	1,200,000 cycles	93 bytes	
2 years	1,000,000 cycles	124 bytes	

1) EEPROM Emulation ROM Library can only be used in the 4 Kbyte Flash variant.

2) These values show the maximum endurance. Maximum endurance is the maximum possible unique data write if each data update is only 31 bytes. Minimum endurance cycle is the maximum possible unique data write if each data update is the same as the emulation size. The minimum endurance cycle can be calculated using the formulae $[(\text{max. endurance}) \cdot (31) / (\text{emulation size})]$.

4 Package and Quality Declaration

Chapter 4 provides the information of the XC822/824 package and reliability section.

4.1 Package Parameters

Table 24 provides the thermal characteristics of the packages used in XC822 and XC824 respectively.

Table 24 Thermal Characteristics of the Packages

Parameter	Symbol		Limit Values		Unit	Package Types
			Min.	Max.		
Thermal resistance junction case ¹⁾	R_{TJC}	CC	-	36.2	K/W	PG-TSSOP-16-1
			-	34.3		K/W
Thermal resistance junction lead ¹⁾	R_{TJL}	CC	-	356.6	K/W	PG-TSSOP-16-1
			-	36.2		K/W

1) The thermal resistances between the case and the ambient (R_{TCA}), the lead and the ambient (R_{TLA}) are to be combined with the thermal resistances between the junction and the case (R_{TJC}), the junction and the lead (R_{TJL}) given above, in order to calculate the total thermal resistance between the junction and the ambient (R_{TJA}). The thermal resistances between the case and the ambient (R_{TCA}), the lead and the ambient (R_{TLA}) depend on the external system (PCB, case) characteristics, and are under user responsibility.

The junction temperature can be calculated using the following equation: $T_J = T_A + R_{TJA} \times P_D$, where the R_{TJA} is the total thermal resistance between the junction and the ambient. This total junction ambient resistance R_{TJA} can be obtained from the upper four partial thermal resistances, by

- a) simply adding only the two thermal resistances (junction lead and lead ambient), or
- b) by taking all four resistances into account, depending on the precision needed.
