TENTATIVE   TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT SILICON GATE CMOS

524,288-WORD BY 16-BIT FULL CMOS STATIC RAM

DESCRIPTION

The TC55VEM316AXBN is a 8,388,608-bit static random access memory (SRAM) organized as 524,288 words by 16 bits. Fabricated using Toshiba's CMOS Silicon gate process technology, this device operates from a single 2.3 to 3.6 V power supply. Advanced circuit technology provides both high speed and low power at an operating current of 3 mA/MHz and a minimum cycle time of 40 ns. It is automatically placed in low-power mode at 0.7 μA standby current (at V_{DD} = 3 V, Ta = 25°C, typical) when chip enable ($\overline{CE1}$) is asserted high or (CE2) is asserted low. There are three control inputs. $\overline{CE1}$ and CE2 are used to select the device and for data retention control, and output enable ($\overline{OE}$) provides fast memory access. Data byte control pin ($\overline{LB}$, $\overline{UB}$) provides lower and upper byte access. This device is well suited to various microprocessor system applications where high speed, low power and battery backup are required. And, with a guaranteed operating extreme temperature range of −40° to 85°C, the TC55VEM316AXBN can be used in environments exhibiting extreme temperature conditions. The TC55VEM316AXBN is available in a plastic 48-ball BGA.

TIMING DIAGRAMS

READ CYCLE ^(See Note 1)
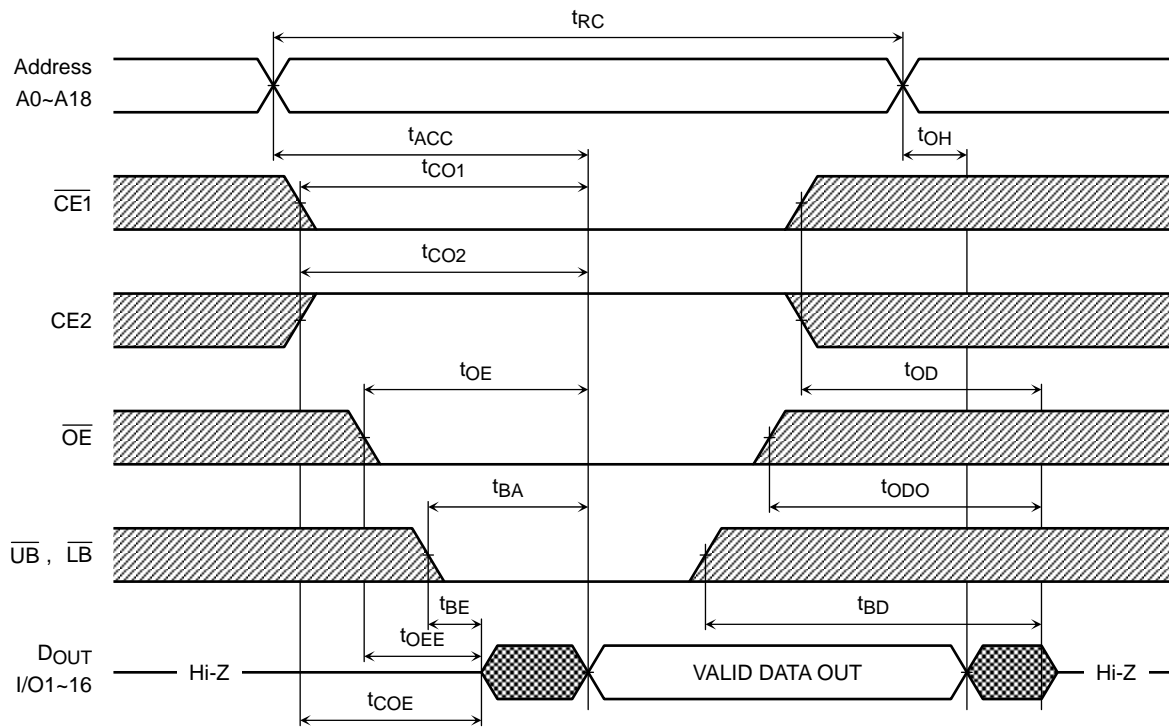

WRITE CYCLE 1 (R/W CONTROLLED) ^(See Note 4)
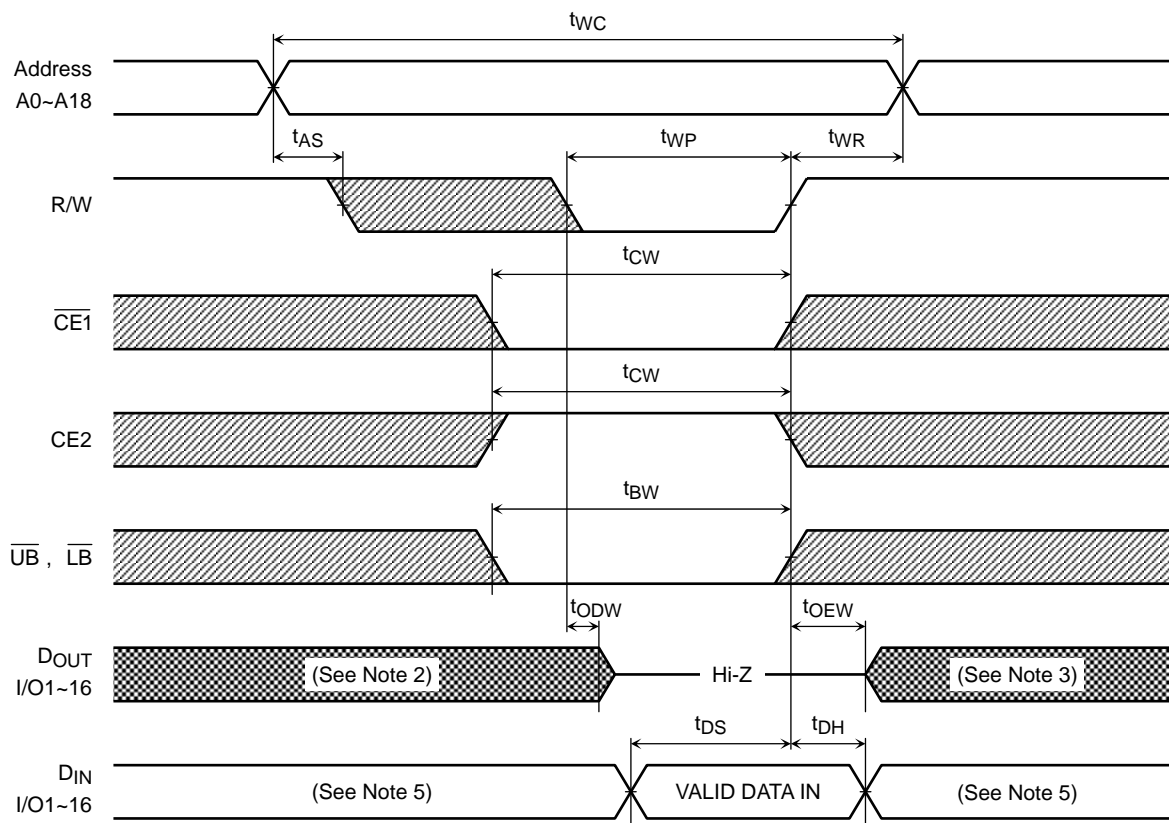

WRITE CYCLE 2 ($\overline{CE1}$ CONTROLLED) (See Note 4)
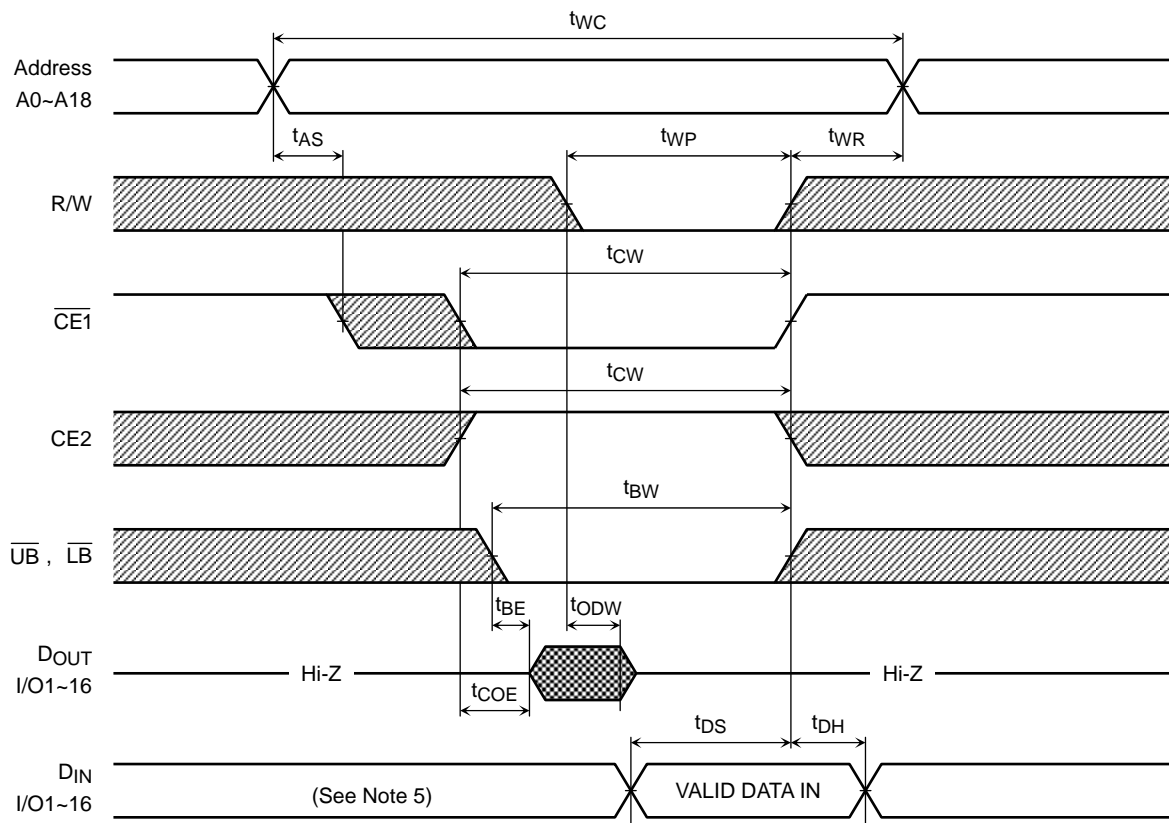

WRITE CYCLE 3 (CE2 CONTROLLED) (See Note 4)
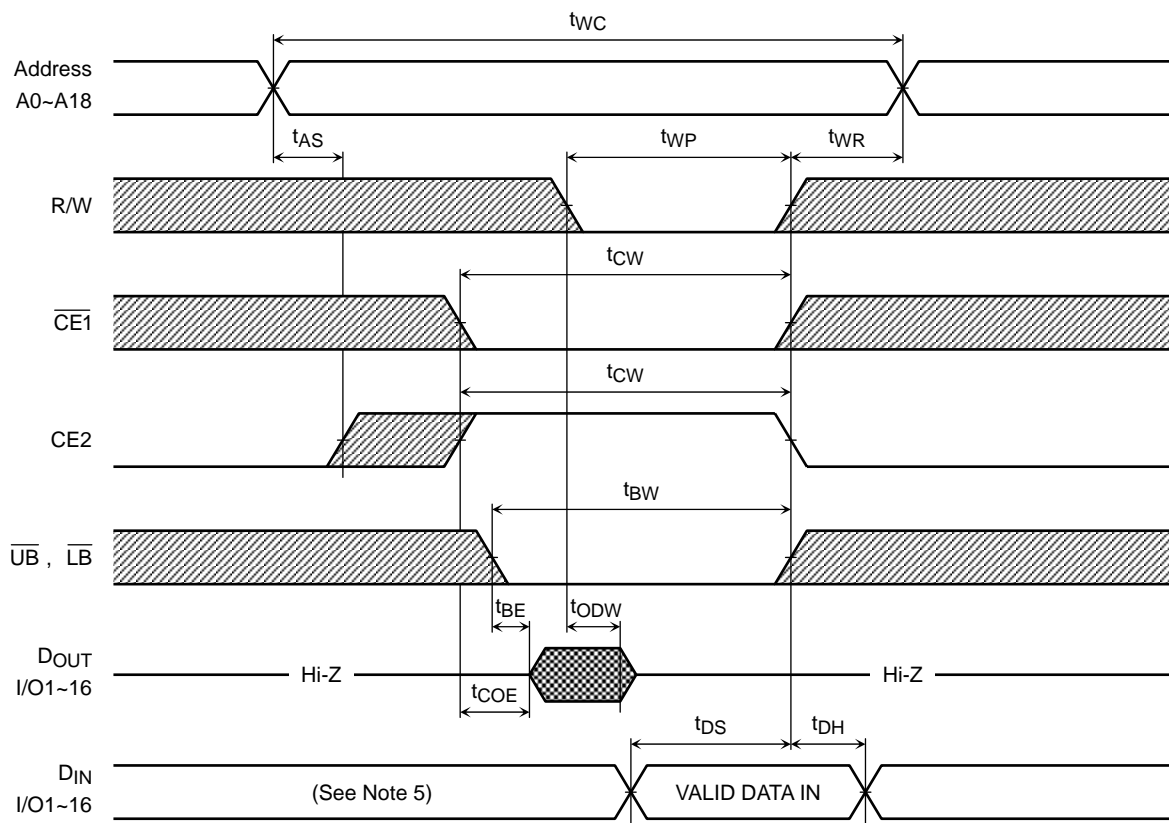

WRITE CYCLE 4 ($\overline{UB}$, $\overline{LB}$ CONTROLLED) (See Note 4)
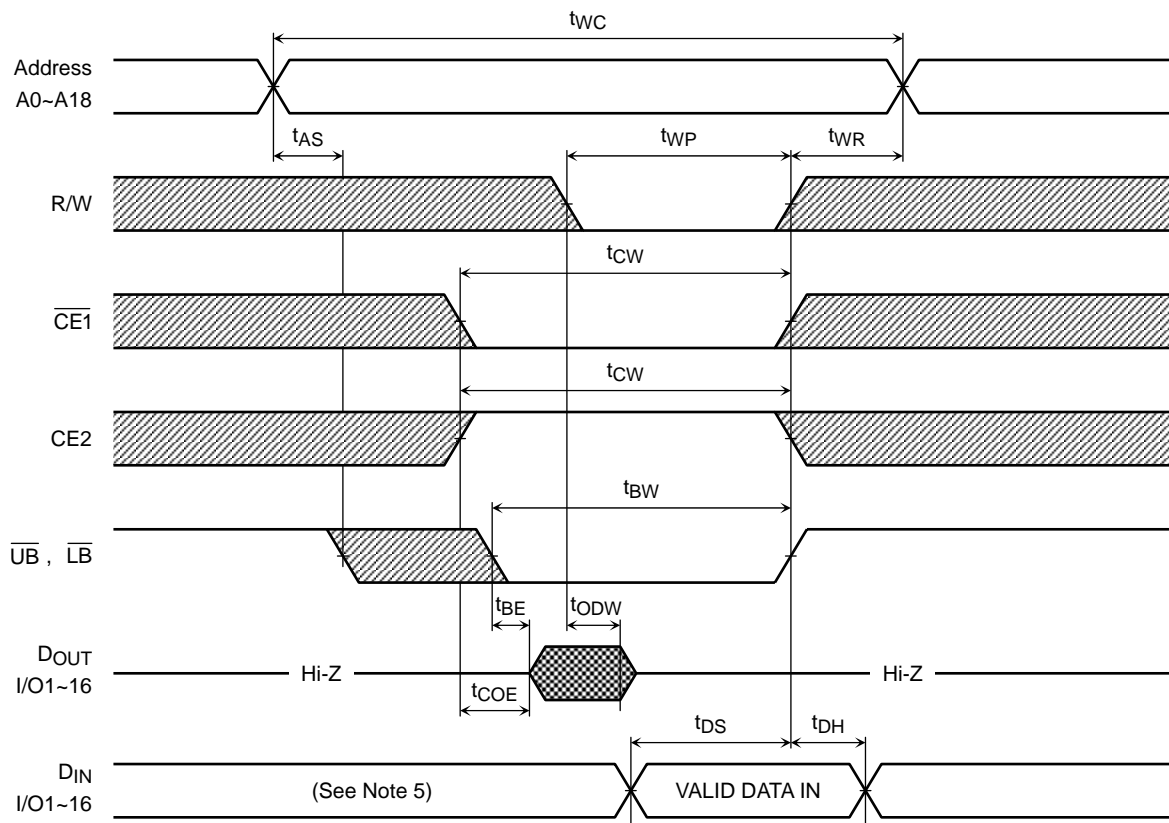

Note:

(1) R/W remains HIGH for the read cycle.

(2) If $\overline{CE1}$ (or $\overline{UB}$ or $\overline{LB}$) goes LOW(or CE2 goes HIGH) coincident with or after R/W goes LOW, the outputs will remain at high impedance.

(3) If $\overline{CE1}$ (or $\overline{UB}$ or $\overline{LB}$) goes HIGH(or CE2 goes LOW) coincident with or before R/W goes HIGH, the outputs will remain at high impedance.

(4) If $\overline{OE}$ is HIGH during the write cycle, the outputs will remain at high impedance.

(5) Because I/O signals may be in the output state at this time, input signals of reverse polarity must not be applied.

(3)   In CE2 controlled data retention mode, minimum standby current mode is entered when $CE2 \leq 0.2$ V.
