# Quick Assembly Two and Three Channel Optical Encoders 

## Technical Data

## Features

- Two Channel Quadrature Output with Optional Index Pulse
- Quick and Easy Assembly
- No Signal Adjustment Required
- External Mounting Ears

Available

- Low Cost
- Resolutions Up to 1024

Counts Per Revolution

- Small Size
- $-40^{\circ} \mathrm{C}$ to $100{ }^{\circ} \mathrm{C}$ Operating Temperature
- TTL Compatible
- Single 5 V Supply

## Description

The HEDS-5500/5540, HEDS5600/5640, and HEDM-5500/ 5600 are high performance, low cost, two and three channel optical incremental encoders. These encoders emphasize high reliability, high resolution, and easy assembly.

Each encoder contains a lensed LED source, an integrated circuit
with detectors and output circuitry, and a codewheel which rotates between the emitter and detector IC. The outputs of the HEDS-5500/5600 and HEDM$5500 / 5600$ are two square waves in quadrature. The HEDS-5540 and 5640 also have a third channel index output in addition to the two channel quadrature. This index output is a 90 electrical degree, high true index pulse which is generated once for each full rotation of the codewheel.

The HEDS series utilizes metal codewheels, while the HEDM series utilizes a film codewheel allowing for resolutions to 1024 CPR. The HEDM series is nont available with a third channel index.

These encoders may be quickly and easily mounted to a motor. For larger diameter motors, the HEDM-5600, and HEDS-5600/ 5640 feature external mounting ears.

The quadrature signals and the index pulse are accessed through

HEDM-550X/560X
HEDS-550X/554X HEDS-560X/564X

five 0.025 inch square pins located on 0.1 inch centers.

Standard resolutions between 96 and 1024 counts per revolution are presently available. Consult local Hewlett-Packard sales representatives for other resolutions.

## Applications

The HEDS-5500, 5540, 5600, 5640, and the HEDM-5500, 5600 provide motion detection at a low cost, making them ideal for high volume applications. Typical applications include printers, plotters, tape drives, positioning tables, and automatic handlers.

## Package Dimensions

HEDS-5500/5540, HEDM-5500

*Note: For the HEDS-5500 and HEDM-5500, Pin \#2 is a No Connect. For the HEDS-5540, Pin \#2 is CH. I, the index output.

HEDS-5600/5640, HEDM-5600

*Note: For the HEDS-5600 and HEDM-5600, Pin \#2 is a No Connect. For the HEDS-5640, Pin \#2 is CH. I, the index output.

## Theory of Operation

The HEDS-5500, 5540, 5600, 5640, and HEDM-5500, 5600 translate the rotary motion of a shaft into either a two- or a threechannel digital output.

As seen in the block diagram, these encoders contain a single Light Emitting Diode (LED) as its light source. The light is collimated into a parallel beam by means of a single polycarbonate lens located directly over the LED. Opposite the emitter is the integrated detector circuit. This IC consists of multiple sets of photodetectors and the signal processing circuitry necessary to produce the digital waveforms.

The codewheel rotates between the emitter and detector, causing the light beam to be interrupted by the pattern of spaces and bars on the codewheel. The photodiodes which detect these interruptions are arranged in a pattern that corresponds to the radius and design of the codewheel. These detectors are also spaced such that a light period on one pair of detectors corresponds to a dark period on the adjacent pair of detectors. The photodiode outputs are then fed through the signal processing circuitry resulting in $\mathrm{A}, \mathrm{A}, \mathrm{B}$ and B (also I and I in the HEDS-5540 and 5640). Comparators receive these signals and produce the final outputs for channels A and B. Due to this integrated phasing technique, the digital output of channel A is in quadrature with that of channel B ( 90 degrees out of phase).

In the HEDS-5540 and 5640, the output of the comparator for I and $I$ is sent to the index processing circuitry along with the outputs of channels A and B.

## Block Diagram

The final output of channel $I$ is an index pulse $\mathrm{P}_{\mathrm{O}}$ which is generated once for each full rotation of the codewheel. This output $\mathrm{P}_{\mathrm{O}}$ is a one state width (nominally 90 electrical degrees), high true index pulse which is coincident with the low states of channels A and $B$.

## Definitions

Count ( $N$ ): The number of bar and window pairs or counts per revolution (CPR) of the codewheel.

One Cycle (C): 360 electrical degrees ( ${ }^{\circ}$ e), 1 bar and window pair.

One Shaft Rotation: 360 mechanical degrees, N cycles.

Position Error $(\Delta \Theta)$ : The normalized angular difference between the actual shaft position and the position indicated by the encoder cycle count.

Cycle Error ( $\Delta C$ ): An indication of cycle uniformity. The difference between an observed shaft angle which gives rise to one electrical cycle, and the nominal angular increment of $1 / \mathrm{N}$ of a
revolution.
Pulse Width (P): The number of electrical degrees that an output is high during 1 cycle. This value is nominally $180^{\circ}$ o or $1 / 2$ cycle.

Pulse Width Error ( $\Delta P$ ): The deviation, in electrical degrees, of the pulse width from its ideal value of $180^{\circ} \mathrm{e}$.

State Width (S): The number of electrical degrees between a transition in the output of channel A and the neighboring transition in the output of channel B. There are 4 states per cycle, each nominally $90^{\circ} e$.

State Width Error ( $\Delta S$ ): The deviation, in electrical degrees, of each state width from its ideal value of $90^{\circ} \mathrm{e}$.

Phase ( $\phi$ ): The number of electrical degrees between the center of the high state of channel A and the center of the high state of channel B. This value is nominally $90^{\circ}{ }^{\circ}$ for quadrature output.

Phase Error ( $\Delta \phi$ ): The deviation of the phase from its ideal value of $90^{\circ} \mathrm{e}$.

## Absolute Maximum Ratings

| Parameter | HEDS-55XX/56XX | HEDM-550X/560X |
| :--- | :--- | :--- |
| Storage Temperature, $\mathrm{T}_{\mathrm{S}}$ | $-40^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}$ | $-40^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |
| Operating Temperature, $\mathrm{T}_{\mathrm{A}}$ | $-40^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}$ | $-40^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |
| Supply Voltage, $\mathrm{V}_{\mathrm{CC}}$ | -0.5 V to 7 V | -0.5 V to 7 V |
| Output Voltage, $\mathrm{V}_{\mathrm{O}}$ | -0.5 V to $\mathrm{V}_{\mathrm{CC}}$ | -0.5 V to $\mathrm{V}_{\mathrm{CC}}$ |
| Output Current per Channel, $\mathrm{I}_{\mathrm{OUT}}$ | -1.0 mA to 5 mA | -1.0 mA to 5 mA |
| Vibration | $20 \mathrm{~g}, 5$ to 1000 Hz | $20 \mathrm{~g}, 5$ to 1000 Hz |
| Shaft Axial Play | $\pm 0.25 \mathrm{~mm}( \pm 0.010 \mathrm{in})$. | $\pm 0.175 \mathrm{~mm}( \pm 0.007 \mathrm{in})$. |
| Shaft Eccentricity Plus Radial Play | $0.1 \mathrm{~mm}(0.004 \mathrm{in}) TIR$. | $0.04 \mathrm{~mm}(0.0015 \mathrm{in}) TIR$. |
| Velocity | $30,000 \mathrm{RPM}$ | $30,000 \mathrm{RPM}$ |
| Acceleration | $250,000 \mathrm{rad} / \mathrm{sec}^{2}$ | $250,000 \mathrm{rad} / \mathrm{sec}^{2}$ |

Direction of Rotation: When the codewheel rotates in the counterclockwise direction (as viewed from the encoder end of the motor), channel A will lead channel B. If the codewheel rotates in the clockwise direction, channel B will lead channel A.

Index Pulse Width $\left(P_{O}\right)$ : The number of electrical degrees that an index output is high during one full shaft rotation. This value is nominally $90^{\circ} \mathrm{e}$ or $1 / 4$ cycle.

Output Waveforms

## Recommended Operating Conditions

| Parameter | Symbol | Min. | Typ. | Max. | Units | Notes |
| :--- | :---: | :---: | :---: | :---: | :---: | :--- |
| Temperature HEDS Series | $\mathrm{T}_{\mathrm{A}}$ | -40 |  | 100 | ${ }^{\circ} \mathrm{C}$ |  |
| Temperature HEDM Series | $\mathrm{T}_{\mathrm{A}}$ | -40 |  | 70 | ${ }^{\circ} \mathrm{C}$ | non-condensing atmosphere |
| Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | 4.5 | 5.0 | 5.5 | Volts | Ripple < $100 \mathrm{mV} \mathrm{p}_{\mathrm{p}-\mathrm{p}}$ |
| Load Capacitance | $\mathrm{C}_{\mathrm{L}}$ |  |  | 100 | pF | $2.7 \mathrm{k} \Omega$ pull-up |
| Count Frequency | f |  |  | 100 | kHz | Velocity (rpm) x N/60 |
| Shaft Perpendicularity <br> Plus Axial Play (HEDS Series) |  |  |  | $\pm 0.25$ <br> $( \pm 0.010)$ | mm <br> (in.) | $6.9 \mathrm{~mm}(0.27 \mathrm{in}$.$) from$ <br> mounting surface |
| Shaft Eccentricity Plus <br> Radial Play (HEDS Series) |  |  |  | 0.04 <br> $(0.0015)$ | mm (in.) <br> TIR | $6.9 \mathrm{~mm}(0.27$ in.) from <br> mounting surface |
| Shaft Perpendicularity <br> Plus Axial Play (HEDM Series) |  |  |  | $\pm 0.175$ <br> $( \pm 0.007)$ | mm <br> (in.) | $6.9 \mathrm{~mm}(0.27$ in.) from <br> mounting surface |
| Shaft Eccentricity Plus <br> Radial Play(HEDM Series) |  |  |  | 0.04 <br> $(0.0015)$ | mm (in.) <br> TIR | $6.9 \mathrm{~mm}(0.27$ in.) from <br> mounting surface |

Note: The module performance is guaranteed to 100 kHz but can operate at higher frequencies. $2.7 \mathrm{k} \Omega$ pull-up resistors required for HEDS-5540 and 5640.

## Encoding Characteristics

Encoding Characteristics over Recommended Operating Range and Recommended Mounting Tolerances unless otherwise specified. Values are for the worst error over the full rotation.

Notes:

1. These are tolerances required of the user.
2. The HEDS-55X5 and 56X5, HEDM-5505, 5605 provide an 8.9 mm ( 0.35 inch) diameter hole through the housing for longer motor shafts. See Ordering Information.
3. The HEDS-5540 and 5640 must be aligned using the aligning pins as specified in Figure 3, or using the alignment tool as shown in "Encoder Mounting and Assembly". See also "Mounting Considerations."
4. The recommended mounting screw torque for 2 screw and external ear mounting is $1.0 \mathrm{~kg}-\mathrm{cm}$ ( $0.88 \mathrm{in}-\mathrm{lbs}$ ). The recommended mounting screw torque for 3 screw mounting is $0.50 \mathrm{~kg}-\mathrm{cm}$ ( $0.43 \mathrm{in}-\mathrm{lbs}$ ).

## Electrical Interface

To insure reliable encoding performance, the HEDS-5540 and 5640 three channel encoders require $2.7 \mathrm{k} \Omega( \pm 10 \%)$ pull-up resistors on output pins 2,3 , and 5 (Channels I, A, and B) as shown in Figure 1. These pull-up resistors should be located as
close to the encoder as possible (within 4 feet). Each of the three encoder outputs can drive a single TTL load in this configuration.

The HEDS-5500, 5600, and HEDM-5500, 5600 two channel encoders do not normally require pull-up resistors. However, $3.2 \mathrm{k} \Omega$
pull-up resistors on output pins 3 and 5 (Channels A and B) are recommended to improve rise times, especially when operating above 100 kHz frequencies.

Figure 1. Pull-up Resistors on HEDS-5X40 Encoder Outputs.

## Mounting Considerations

The HEDS-5540 and 5640 three channel encoders and the HEDM Series high resolution encoders must be aligned using the aligning pins as specified in Figure 3, or using the HEDS-8910 Alignment Tool as shown in Encoder Mounting and Assembly.

The use of aligning pins or alignment tool is recommended but not required to mount the HEDS-5500 and 5600. If these
two channel encoders are attached to a motor with the screw sizes and mounting tolerances specified in the mechanical characteristics section without any additional mounting bosses, the encoder output errors will be within the maximums specified in the encoding characteristics section.

The HEDS-5500 and 5540 can be mounted to a motor using either the two screw or three screw
mounting option as shown in Figure 2. The optional aligning pins shown in Figure 3 can be used with either mounting option.

The HEDS-5600, 5640, and HEDM-5600 have external mounting ears which may be used for mounting to larger motor base plates. Figure 4 shows the necessary mounting holes with optional aligning pins and motor boss.

Figure 2. Mounting Holes.

Figure 3. Optional Mounting Aids.

Figure 4. Mounting with External Ears.

## Encoder Mounting and Assembly

1. For HEDS-5500 and 5600: Mount encoder base plate onto motor. Tighten screws. Go on to step 2.

1a. For HEDS-5540, 5640 and HEDM-5500, 5600: Slip alignment tool onto motor shaft. With alignment tool in place, mount encoder baseplate onto motor as shown above. Tighten screws. Remove alignment tool.

3a. Push the hex wrench into the body of the encoder to ensure that it is properly seated into the code wheel hub set screws. Then apply a downward force on the end of the hex wrench. This sets the code wheel gap by levering the code wheel hub to its upper position.

3b. While continuing to apply a downward force, rotate the hex wrench in the clockwise direction until the hub set screw is tight against the motor shaft. The hub set screw attaches the code wheel to the motor's shaft.

3c. Remove the hex wrench by pulling it straight out of the encoder body.

2. Snap encoder body onto base plate locking all 4 snaps.

4. Use the center screwdriver slot, or either of the two side slots, to rotate the encoder cap dot clockwise from the one dot position to the two dot position. Do not rotate the encoder cap counterclockwise beyond the one dot position.

The encoder is ready for use!
