1.5A Li-ion/Li Polymer Battery Charger

General Description

The EMC5050 is a highly-integrated battery charger for single-cell Li-ion or Li-polymer batteries capable of operating with an input voltage reached 2.5V. It is a complete charger device designed to work with an USB port or 5V output AC adapter.

The EMC5050 operates with CC (constant current) mode and CV (constant voltage) mode profiles. A low-current preconditioning charge mode is also provided as a trickle charging operation. The charge current is programmable up to 1.5A with an external resistor or a logic input. The charge voltage is 1% accurate over the full application range.

When operating with a current-limited adapter, the charger minimizes the thermal dissipation with pulsed operations to prevent overheat conditions that is commonly occurred with conventional linear chargers. The EMC5050 reduces charge current for thermal fold-back to ensure product safe operation. The charger automatically re-charges the battery when the battery voltage drops blow a recharge threshold. The chip includes a safety timer for setting the fast charge time limit in case of charging a dead battery.

Additional features include preconditioning of an over-discharged battery and charging the battery in a safe temperature range with an NTC thermistor interface. The thermally enhanced TQFN packages are offered for space limited handheld applications.

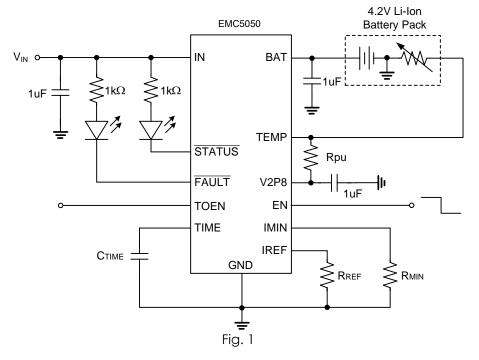

Features

- Complete Charger for Single-Cell Li-ion Batteries
- Charges from either AC Adapter or USB Port
- Integrated Power Pass Device with Current Sensing
- No External Blocking Diode Required
- Pre-charge Condition with Safety Timing
- 1% Charger Voltage Accuracy
- Programmable Current Limit up to 1.5A
- Programmable End-of-Charge Current
- Sleep Mode for Power Saving
- Charge Current Thermal Fold-back
- NTC Thermistor Interface for Battery Temperature
- Monitor
- Stand-Alone or Integrated Charger
- Ambient Temperature Range: -40°C to +85°C
- Thermally-Enhanced TQFN-16L 4mmx4mm
 Packages
- Pb-Free Plus Anneal Available (RoHS Compliant

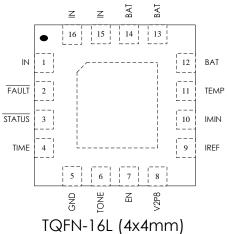

Applications

- PDAs, Cell Phones and Smart Phones
- Digital Camera, MP3 and Handheld Gamming
- Portable Instruments including Medical Handhelds
- Self-Charging Battery Packs
- Stand-Alone Chargers or USB Port Chargers

Typical Application

Package Configuration

EMC5050-42HC16NRR

Pin Functions

Pin Name	TQFN-16L	Function	
1,15,16	IN	Charger Input Supply Voltage.	
2	FAULT	Active-low, open-drain output, capable sinking 5mA current.	
3	STATUS	Open-drain pin to show charging and Inhibit states, capable sinking of 5mA current.	
4	TIME	Timing capacitor pin for connecting a capacitor to set internal clocking and charger time reference.	
5	GND	Ground pin.	
6	TOEN	Timeout enable control, high to enable timeout function during charge battery, low to disable TIMEOUT limit with internal 200Kohm pull-up.	
7	EN	Chip enable control, high to activate the chip with internal 880Kohm pull-u	
8	V2P8	2.8V reference voltage output, capable drives up to 2mA.	
9	IREF	A resistor can be connected at the pin to set the charge current.	
10	IMIN	A resistor can be connected at this pin to set End-of-Charge Current.	
11	TEMP	Battery Temperature input for NTC thermistor input, can be used for battery removal detection.	
12, 13,14	BAT	Connection to the battery positive node.

Note 1: T_J is a function of the ambient temperature T_A and power dissipation P_D ($T_J = T_A + (P_D) * \theta_{JA}$)).

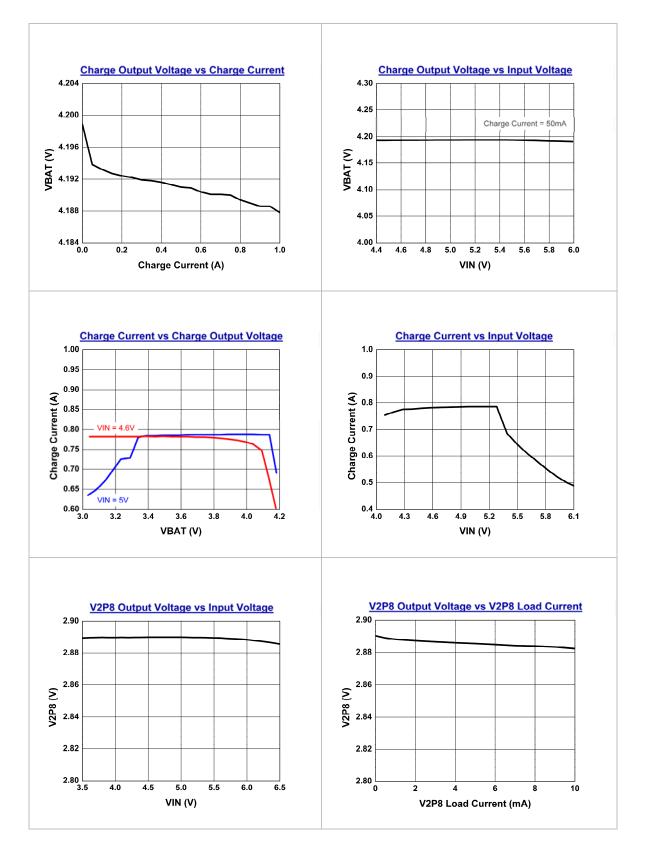

Note 2: θ_{JA} is measured in the natural convection at $T_A=25^{\circ}$ C on a highly effective thermal conductivity test board (2 layers , 2SOP) according to the JEDEC 51-7 thermal measurement standard.

Note 3: θ_{JC} represents the heat resistance between the chip and the package top case.

Typical Performance Characteristics

The test conditions for the typical operating performance are: $V_{IN} = 5V$, $T_A = +25^{\circ}C$, $R_{REF} = 100k\Omega$, $V_{BAT} = 3.7V$, Unless otherwise noted.

Description of Charger Operation

The EMC5050 initiates a charger operation when attached with a voltage source device or adaptor. Fig. 4 shows a typical charge profile when the chip operates as a conventional linear charger with a constant voltage source. The charging current is set by an external resistor up to 1.5A. The target charging voltage is 1% accurate over the specified range.

The charger IC resets internal operational circuits when internal Power-on-reset (POR) signal becomes valid. V2P8 presents a voltage reference output source capable driving 2mA current after POR. Other indication output pins are STATUS and FAULT. The STATUS is active low as an open-drain type to indicate a charging cycle and valid till EOC. The FAULT output signal becomes low to signal any occurred fault conditions such as a charging time fault, battery temperature fault or when the battery is detached. When charge with a current-limited adapter, EMC5050 should be programmed with IREF over the upper limit of ILIM. A typical charge profile is displayed in Fig. 5 for minimizing power dissipation during CC mode. The worst power dissipation is often at the start of CV mode, although thermal fold-back conditions could still occur in this application case.

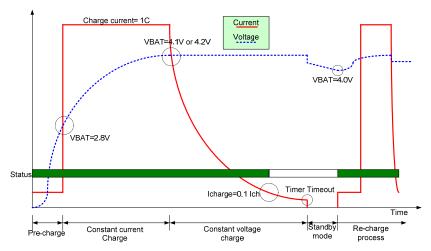

Fig. 4 A typical charger profile as a conventional linear charger

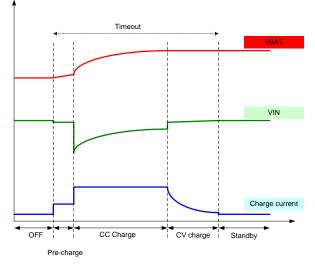

Fig. 5 A typical charge profile with a current-limited adapter

Application Information

One linear charging case, the EMC5050 performs either constant current (CC) and constant voltage (CV) profiles. The charging current is set by an external resistor up to 1.5A. The target charging voltage is 1% accurate over the specified range. EMC5050 enters a trickle mode for preconditioning operation each time when a charging cycle starts till that the minimum charging voltage is reached and verified in 15 clock cycles.

A thermal-feedback function offers thermal protection during linear charging operations. When the internal temperature EMC5050 goes up above 100 degree C, the charger automatically reduces the

charging current. TEMP pin is examined for charging temperature during the charging operation. The temperature range is determined with an external NTC thermistor. The NTC need have 7:1 for Rcold to

Rhot, once user choose a NTC, the temperature range will be fixed also, then we will have

2.0=3.0*Rcold/(Rpu+Rcold)...... 1.0=3.0*Rhot/(Rpu+Rhot)......

Using these two formulas, we can get Rpu, and also can get Rcold and Rhot refer the NTC table.

EMC5050 provides a TIMEOUT limit to prevent charging a dead battery for extensive time. Recharging is automatically started when batter voltage drop to the recharging threshold point. EMC5050 enters the shutdown mode in case no voltage adapter is attached.

STATUS	FAULT	Condition	
Lligh	Lligh	Power-down, charging is	
High	High	suspended or interrupted	
Low	High	Charging	
Lliste	Laur	Bad battery	
High	Low	(Safety timer expired)	

Charge current setting

$$I_{charge} = 0.8 \times \left(\frac{10^5}{R_{REF}}\right)$$
 Where R_{REF} in KΩ

Charge timer setting

$$Time = 14 imes rac{C_{time}}{1nF}$$
 Where $Time$ in Minutes

End-of-Charge Current setting

$$I_{MN} = \frac{8000}{R_{MN}} \quad \text{Where } R_{MN} \text{ in K}\Omega$$
