**ROHM** SEMICONDUCTOR

Serial EEPROM Series Automotive EEPROM

## 125℃ Operation Microwire BUS EEPROM(3-Wire)

# BR93Hxx-WC
# (2K 4K 8K 16K)

## ●General Description

BR93Hxx-WC is a serial EEPROM of serial 3-line interface method.

## ●Features

- Conforming to Microwire BUS
- Withstands electrostatic voltage 8kV,
  (HBM method typ.,except BR93H66RFVM-WC)
- Wide temperature range -40℃ to +125℃
- Same package line up and same pin configuration
- 2.7V to 5.5V single supply voltage operation
- Address auto increment function at read operation
- Write mistake prevention function
  - ➢ Write prohibition at power on
  - ➢ Write prohibition by command code
  - ➢ Write mistake prevention circuit at low voltage
- Program cycle auto delete and auto end function
- Program condition display by READY / BUSY
- Low current consumption
  - ➢ At write operation (at 5V) : 0.6mA (Typ.)
  - ➢ At read operation (at 5V) : 0.6mA (Typ.)
  - ➢ At standby condition (at 5V) : 0.1μA(Typ.)(CMOS input)
- Built-in noise filter CS, SK, DI terminals
- High reliability by ROHM original Double-Cell structure
- Data retention for 20 years (Ta≦125℃)
- Endurance up to 300,000 times (Ta≦125℃)
- Data at shipment all address FFFFh
- AEC-Q100 Qualified

●**Sync data input / output timing**

○Data is taken by DI sync with the rise of SK.

○At read operation, data is output from DO in sync with the rise of SK.

○The status signal at write (READY / BUSY) is output after tCS from the fall of CS after write command input, at the area DO where CS is "H", and valid until the next command start bit is input. And, white CS is "L", DO becomes High-Z.

○After completion of each mode execution, set CS "L" once for internal circuit reset, and execute the following operation mode.

●**Description of Operations**

Communications of the Microwire Bus are carried out by SK (serial clock), DI (serial data input), DO (serial data output), and CS (chip select) for device selection.

When to connect one EEPROM to a microcontroller, connect it as shown in Figure 27-(a) or Figure 27-(b). When to use the input and output common I/O port of the microcontroller, connect DI and DO via a resistor as shown in Figure 27-(b) (Refer to page 16.), and connection by 3 lines is available.
In the case of plural connections, refer to Figure 27-(c).

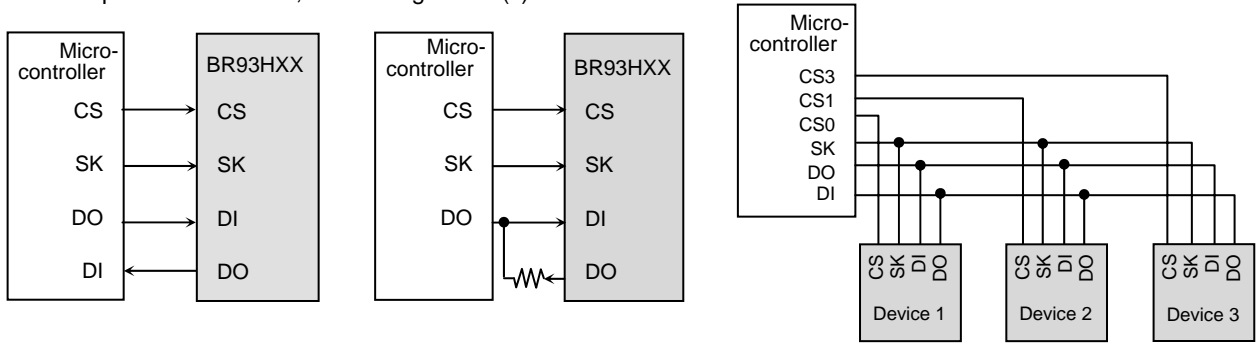

Figure 27-(a) Connection by 4 lines    Figure 27-(b) Connection by 3 lines    Figure 27-(c) Connection example of plural devices

Figure 27. Connection method with microcontroller

Communications of the Microwire Bus are started by the first "1" input after the rise of CS. This input is called a start bit. After input of the start bit, input ope code, address and data. Address and data are input all in MSB first manners.

"0" input after the rise of CS to the start bit input is all ignored. Therefore, when there is limitation in the bit width of PIO of the microcontroller, input "0" before the start bit input, to control the bit width.

●**Command Mode**

| Command | Start bit | Ope code | Address | | Data |
|---|---|---|---|---|---|
| | | | BR93H56/66-WC | BR93H76/86-WC | |
| Read (READ) *1 | 1 | 10 | A7,A6,A5,A4,A3,A2,A1,A0 | A9,A8,A7,A6,A5,A4,A3,A2,A1,A0 | D15 to D0(READ DATA) |
| Write enable (WEN) | 1 | 00 | 1 1 * * * * * * * | 1 1 * * * * * * * * * | |
| Write (WRITE) *2 | 1 | 01 | A7,A6,A5,A4,A3,A2,A1,A0 | A9,A8,A7,A6,A5,A4,A3,A2,A1,A0 | D15 to D0(WRITE DATA) |
| Write all (WRAL) *2,3 | 1 | 00 | 0 1 * * * * * B0 | 0 1 * * * * * B2,B1,B0 | D15 to D0(WRITE DATA) |
| Write disable (WDS) | 1 | 00 | 0 0 * * * * * * * | 0 0 * * * * * * * * * | |

・ Input the address and the data in MSB first manners.

・ As for *, input either VIH or VIL.

*Start bit

Acceptance of all the commands of this IC starts at recognition of the start bit.
The start bit means the first "1" input after the rise of CS.

A7 and B0 of BR93H56-WC becomes Don't Care.
A9 and B2 of BR93H76-WC becomes Don't Care.

*1 As for read, by continuous SK clock input after setting the read command, data output of the set address starts, and address data in significant order are sequentially output continuously. (Auto increment function)

*2 When the read and the write all commands are executed, data written in the selected memory cell is automatically deleted, and input data is written.

*3 For the write all command, data written in memory cell of the areas designated by B2, B1, and B0, are automatically deleted, and input data is written in bulk.

●**Write All Area**

| B2 | B1 | B0 | Write area |
|---|---|---|---|
| 0 | 0 | 0 | 000h to 07Fh |
| 0 | 0 | 1 | 080h to 0FFh |
| 0 | 1 | 0 | 100h to 17Fh |
| 0 | 1 | 1 | 180h to 1FFh |
| 1 | 0 | 0 | 200h to 27Fh |
| 1 | 0 | 1 | 280h to 2FFh |
| 1 | 1 | 0 | 300h to 37Fh |
| 1 | 1 | 1 | 380h to 3FFh |

Designation of B2, B1, and B0

| H56 | * | * | * |
|---|---|---|---|
| H66 | * | * | B0 |
| H76 | * | B1 | B0 |
| H86 | B2 | B1 | B0 |

・The write all command is written in bulk in 2Kbit unit.

The write area can be selected up to 3bit. Confirm the settings and write areas of the above B2, B1, and B0.

●**Timing Chart**

1) Read cycle (READ)

CS

SK    *1    1  2    4    n  n+1

DI    1  1  0  Am    A1  A0

DO    High-Z    0  D15  D14    D1  D0  D15  D14    *2

BR93H56/66-WC : n=27, m=7
BR93H76/86-WC : n=29, m=9

*2 The following address data output (auto increment function)

*1 Start bit
When data "1" is input for the first time after the rise of CS, this is recognized as a start bit. And when "1" is input after plural "0" are input, it is recognized as a start bit, and the following operation is started. This is common to all the commands to described hereafter.
Figure 28. Read cycle

○When the read command is recognized, input address data (16bit) is output to serial. And at that moment, at taking A0, in sync with the rise of SK, "0" (dummy bit) is output. And, the following data is output in sync with the rise of SK.
This IC has address auto increment function valid only at read command. This is the function where after the above read execution, by continuously inputting SK clock, the above address data is read sequentially. And, during the auto increment, keep CS at "H".

2) Write cycle (WRITE)

CS    tCS  STATUS

SK    1  2  4    n

DI    1  0  1  Am    A1  A0  D15  D14    D1  D0

DO    High-Z    tSV  BUSY  READY

tE/W

BR93H56/66-WC : n=27, m=7
BR93H76/86-WC : n=29, m=9

Figure 29. Write cycle

○In this command, input 16bit data (D15 to D0) are written to designated addresses (Am to A0). The actual write starts by the fall of CS of D0 taken SK clock(n-th clock from the start bit input), to the rise of the (n+1)-th clock.
When STATUS is not detected, (CS="L" fixed) Max. 10ms(Max.5ms:BR93H66RFVM-WC) in conformity with tE/W, and when STATUS is detected (CS="H"), all commands are not accepted for areas where "L" (BUSY) is output from D0, therefore, do not input any command.
Write is not made even if CS is started after input of clock after (n+1)-th clocks.
Note) Take tSKH or more from the rise of the n-th clock to the fall of CS.

3) Write all cycle (WRAL)

CS    tCS  STATUS

SK    1  2    5    m    n

DI    1  0  0  0  1    B2  B1  B0  D15    D1  D0

DO    High-Z    tSV  BUSY  READY

tE/W

BR93H56/66-WC : n=27, m=9
BR93H76/86-WC : n=29, m=11
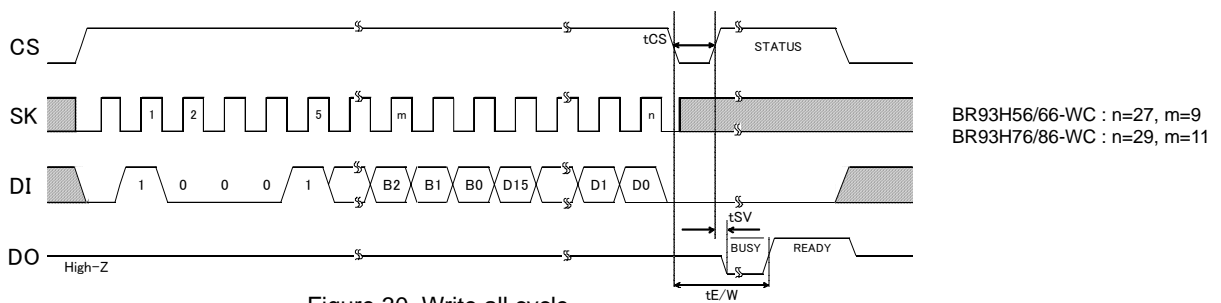

Figure 30. Write all cycle

○In this command, input 16bit data is written simultaneously to designated block for 128 words. Data is writen in bulk at a write time of only Max. 10ms(Max.5ms:BR93H66RFVM-WC) in conformity with tE/W. When writing data to all addresses, designate each block by B2, B1, and B0, and execute write. Write time is Max.10ms(Max.5ms:BR93H66RFVM-WC). The actual write starts by the fall of CS from the rise of D0 taken at SK clock (n-th clock from the start bit input), to the rise of the (n+1)-th clock. When CS is ended after clock input after the rise of the (n+1)-th clock, command is cancelled, and write is not completed.
Note)Take tSKH or more from the rise of the n-th clock to the fall of CS.

4) Write enable (WEN) / disable (WDS) cycle

BR93H56/66-WC : n=11
BR93H76/86-WC : n=13

Figure 31. Write enable (WEN) / disable (WDS) cycle

○At power on, this IC is in write disable status by the internal RESET circuit. Before executing the write command, it is necessary to execute the write enable command. And, once this command is executed, it is valid unitl the write disable command is executed or the power is turned off. However, the read command is valid irrespective of write enable / disable command. Input to SK after 6 clocks of this command is available by either "H" or "L", but be sure to input it.

○When the write enable command is executed after power on, write enable status gets in. When the write disable command is executed then, the IC gets in write disable status as same as at power on, and then the write command is cancelled thereafter in software manner. However, the read command is executable. In write enable status, even when the write command is input by mistake, write is started. To prevent such a mistake, it is recommended to execute the write disable command after completion of write.

● **Application**

1) Method to cancel each command
   ○READ

*1 Address is 8 bits in BR93H56-WC, and BR93H66-WC.
   Address is 10 bits in BR93H76-WC, and BR93H86-WC.

Cancel is available in all areas in read mode.
●Method to cancel : cancel by CS= "L"

Figure 32. READ cancel available timing

○WRITE, WRAL

(Case of BR93H56-WC)

a : From start bit to 27 clock rise
   Cancel by CS="L"

b : 27 clock rise and after *2
   Cancellation is not available by any means. If Vcc is made OFF in this area, designated address data is not guaranteed, therefore write once again.

c : 28 clock rise and after *3
   Cancel by CS="L"
   However, when write is started in b area (CS is ended), cancellation is not available by any means.
   And when SK clock is input continuously, cancellation is not available.

*1 Address is 8 bits in BR93H56/66-WC
   Address is 10 bits in BR93H76/86-WC
*2 27 clocks in BR93H56/66-WC
   29 clocks in BR93H76/86-WC
*3 28 clocks in BR93H56/66-WC
   30 clocks in BR93H76/86-WC

Note 1)  If Vcc is made OFF in this area, designated address data is not guaranteed, therefore write once again.

Note 2)  If CS is started at the same timing as that of the SK rise, write execution/cancel becomes unstable, therefore, it is recommended to fail in SK="L" area. As for SK rise, recommend timing of tCSS/tCSH or higher.

Figure 33. WRITE, WRAL cancel available timing

2) Equivalent circuit
　○Output circuit

Figure 34.　Output circuit (DO)

○　Input circuit

Figure 35. Input circuit (CS)

Figure 36. Input circuit (TEST1, TEST)

Figure 37. Input circuit (SK, DI)

Figure 38. Input circuit (TEST2)

3) I/O peripheral circuit
　3-1)　Pull down CS.
　　　　By making CS="L" at power ON/OFF, mistake in operation and mistake write are prevented.
　　　　Refer to the item 6) Notes at power ON/OFF in page 20.

○Pull down resistance Rpd of CS pin
　To prevent mistake in operation and mistake write at power ON/OFF, CS pull down resistance is necessary.
　Select an appropriate value to this resistance value from microcontroller VOH, IOH, and VIL characteristics of this IC.

Figure 39. CS pull down resistance

$$Rpd \geqq \frac{VOHM}{IOHM} \quad \cdots ①$$

$$VOHM \geqq VIHE \quad \cdots ②$$

Example) When $V_{CC}$ =5V, VIHE=2V, VOHM=2.4V, IOHM=2mA,
　　　　from the equation ①,

$$Rpd \geqq \frac{2.4}{2 \times 10^{-3}}$$

$$\therefore \quad Rpd \geqq 1.2 [k\Omega]$$

With the value of Rpd to satisfy the above equation, VOHM becomes 2.4V or higher, and VIHE (=2.0V), the equation ② is also satisfied.

・VIHE 　: EEPROM VIH specifications
・VOHM 　: Microcontroller VOH specifications
・IOHM 　:Microcontroller IOH specifications

**6.Nov.2013 Rev.002**

3-2) DO is available in both pull up and pull down.
Do output become "High-Z" in other READY / $\overline{\text{BUSY}}$ output timing than after data output at read command and write command. When malfunction occurs at "High-Z" input of the microcontroller port connected to DO, it is necessary to pull down and pull up DO. When there is no influence upon the microcontroller operations, DO may be OPEN. If DO is OPEN, and at timing to output status READY, at timing of CS="H", SK="H", DI="H", EEPROM recognizes this as a start bit, resets READY output, and DO="High-Z", therefore, READY signal cannot be detected. To avoid such output, pull up DO pin for improvement.

Figure 40. READY output timing at DO=OPEN

○Pull up resistance Rpu and pull down resistance Rpd of DO pin
As for pull up and pull down resistance value, select an appropriate value to this resistance value from microcontroller VIH, VIL, and VOH, IOH, VOL, IOL characteristics of this IC.

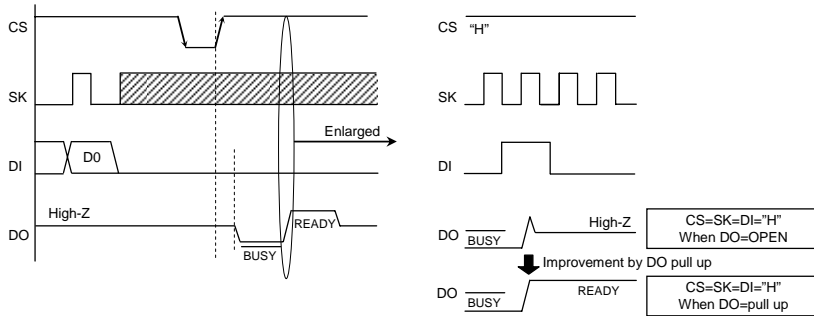

Figure 41. DO pull up resistance

$$Rpu \geqq \frac{Vcc - VOLE}{IOLE} \quad \cdots ③$$

$$VOLE \leqq VILM \quad \cdots ④$$

Example) When $V_{CC}$ =5V, VOLE=0.4V, IOLE=2.1mA, VILM=0.8V, from the equation ③,

$$Rpu \geqq \frac{5 - 0.4}{2.1 \times 10^{-3}}$$

$$\therefore \quad Rpu \geqq 2.2 \, [k\Omega]$$

With the value of Rpu to satisfy the above equation, VOLE becomes 0.4V or below, and with VILM(=0.8V), the equation ④ is also satisfied.

・VOLE : EEPROM VOL specifications
・IOLE : EEPROM IOL specifications
・VILM : Microcontroller VIL specifications

$$Rpd \geqq \frac{VOHE}{IOHE} \quad \cdots ⑤$$

$$VOHE \geqq VIHM \quad \cdots ⑥$$

Example) When $V_{CC}$ =5V, VOHE=Vcc−0.2V, IOHE=0.1mA, VIHM=Vcc×0.7V from the equation ⑤

$$Rpd \geqq \frac{5 - 0.2}{0.1 \times 10^{-3}}$$

$$\therefore \quad Rpd \geqq 48 \, [k\Omega]$$

With the value of Rpd to satisfy the above equation, VOHE becomes 2.4V or below, and with VIHM (=3.5V), the equation ⑥ is also satisfied.

Figure 42. DO pull down resistance

・VOHE : EEPROM VOH specifications
・IOHE : EEPROM IOH specifications
・VIHM : Microcontroller VIH specifications

○READY / $\overline{BUSY}$ status display (DO terminal)
  (common to BR93H56-WC, BR93H66-WC, BR93H76-WC, BR93H86-WC)
  This display outputs the internal status signal. When CS is started after tCS (Min.200ns)
  from CS fall after write command input, "H" or "L" output.

  R/$\overline{B}$ display＝"L" ($\overline{BUSY}$) = write under execution
(DO status)
    After the timer circuit in the IC works and creates the period of tE/W, this time circuit completes automatically.
    And write to the memory cell is made in the period of tE/W, and during this period, other command is not accepted.

  R/$\overline{B}$ display = "H" (READY) = command wait status
(DO status)
    Even after tE/W (max.10ms) (Max.5ms:BR93H66RFVM-WC) from write of the memory cell, the following
    command is accepted.
    Therefore, CS="H" in the period of tE/W, and when input is in SK, DI, malfunction may occur, therefore,
    DI="L" in the area CS="H". (Especially, in the case of shared input port, attention is required.)

  *Do not input any command while status signal is output. Command input in $\overline{BUSY}$ area is cancelled, but command input in READY area is accepted.
   Therefore, status READY output is cancelled, and malfunction and mistake write may be made.

Figure 43. R/$\overline{B}$ status output timing chart

4) When to directly connect DI and DO
    This IC has independent input terminal DI and output terminal DO, and separate signals are handled on timing chart,
    meanwhile, by inserting a resistance R between these DI and DO terminals, it is possible to carry out control by 1
    control line.

Figure 44. DI, DO control line common connection

○Data collision of microcontroller DI/O output and DO output and feedback of DO output to DI input.
    Drive from the microcontroller DI/O output to DI input on I/O timing, and signal output from DO output occur at the
    same time in the following points.

4-1) 1 clock cycle to take in A0 address data at read command
    Dummy bit "0" is output to DO terminal.
    →When address data A0 = "1" input, through current route occurs.

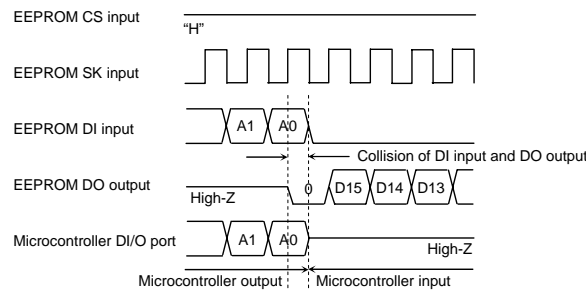

Figure 45. Collision timing at read data output at DI, DO direct connection

17/27

4-2) Timing of CS = "H" after write command. DO terminal in READY / $\overline{BUSY}$ function output.
   When the next start bit input is recognized, "HIGH-Z" gets in.
   →Especially, at command input after write, when CS input is started with microcontroller DI/O output "L",
   READY output "H" is output from DO terminal, and through current route occurs.

Feedback input at timing of these 4-1) and 4-2) does not cause disorder in basic operations, if resistance R is inserted.

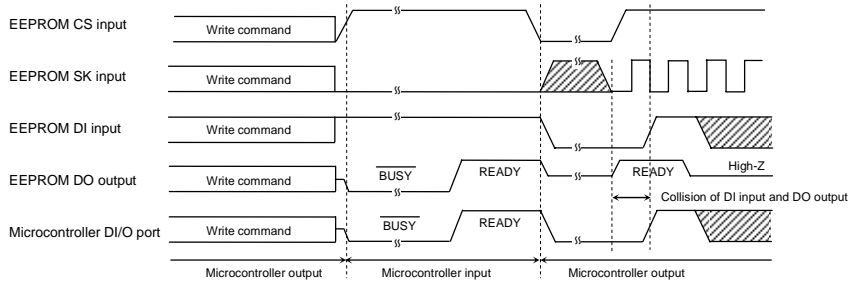

Figure 46. Collision timing at DI, DO direct connection

○Selection of resistance value R
   The resistance R becomes through current limit resistance at data collision. When through current flows, noises of power source line and instantaneous stop of power source may occur. When allowable through current is defined as I, the following relation should be satisfied. Determine allowable current amount in consideration of impedance and so forth of power source line in set. And insert resistance R, and set the value R to satisfy EEPROM input level VIH/VIL, even under influence of voltage decline owing to leak current and so forth. Insertion of R will not cause any influence upon basic operations.

4-3) Address data A0 = "1" input, dummy bit "0" output timing
   (When microcontroller DI/O output is "H", EEPROM DO outputs "L", and "H" is input to DI)
   ・Make the through current to EEPROM 10mA or below.
   ・See to it that the input level VIH of EEPROM should satisfy the following.

Conditions

$$VOHM \leqq VIHE$$
$$VOHM \leqq IOHM \times R + VOLE$$
At this moment, if VOLE=0V,
$$VOHM \leqq IOHM \times R$$
$$\therefore \quad R \geqq \frac{VOHM}{IOHM} \quad \cdots ⑦$$

・VIHE : EEPROM VIH specifications
・VOLE : EEPROM VOL specifications
・VOHM : Microcontroller VOH specifications
・IOHM : Microcontroller IOH specifications

Figure 47. Circuit at DI, DO direct connection (Microcontroller DI/O "H" output, EEPROM "L" output)

TSZ22111・15・001
18/27
**TSZ02201-0R1R0G100160-1-2**
**6.Nov.2013 Rev.002**

4-4) DO status READY output timing
　(When the microcontroller DI/O is "L", EEPROM DO outputs "H", and "L" is input to DI)
　・Set the EEPROM input level VIL so as to satisfy the following.

Conditions

$$VOLM \geqq VILE$$
$$VOLM \geqq VOHE - IOLM \times R$$

As this moment, if VOHE=Vcc,

$$VOLM \geqq Vcc - IOLM \times R$$

$$\therefore \quad R \geqq \frac{Vcc - VOLM}{IOLM} \quad \cdots ⑧$$

・VILE ：EEPROM VIL specifications
・VOHE ：EEPROM VOH specifications
・VOLM ：Microcontroller VOL specifications
・IOLM ：Microcontroller IOL specifications

Example) When Vcc=5V, VOHM=5V, IOHM=0.4mA, VOLM=5V, IOLM=0.4mA,

From the equation ⑦,

$$R \geqq \frac{VOHM}{IOHM}$$
$$R \geqq \frac{5}{0.4 \times 10^{-3}}$$

$$\therefore \quad R \geqq 12.5\,[k\Omega] \quad \cdots ⑨$$

From the equation ⑧,

$$R \geqq \frac{Vcc -}{VOLM}$$

$$R \geqq \frac{IOLM}{5 - 0.4}$$

$$2.1 \times 10^{-3}$$

$$\therefore \quad R \geqq 2.2\,[k\Omega] \quad \cdots ⑩$$

Therefore, from the equations ⑨ and ⑩,

$$\therefore \quad R \geqq 12.5\,[k\Omega]$$

Figure 48. Circuit at DI, DO direct connection (Microcontroller DI/O "L" output, EEPROM "H" output)

5) Notes at test pin wrong input

There is no influence of external input upon TEST2 pin.
For TEST1 (TEST)pin, input must be GND or OPEN. If H level is input, the following may occur,

1.　At WEN, WDS, READ command input
　There is no influence by TEST1 (TEST) pin.

2.　WRITE, WRAL command input

　　　　　\* BR93H56-WC, BR93H66-WC, address 8 bits
　　　　　BR93H76-WC, BR93H86-WC, address 10 bits

| Start bit | Ope code | Address* | Data | tE/W |
|-----------|----------|----------|------|------|
| 1bits | 2bits | 8bits | 16bits | |

a

Write start
CS　rise timing
Figure 49.TEST1(TEST) pin wrong input timing

　a：There is no influence by TEST1 (TEST) pin.

　b：If H during write execution, it may not be written correctly. And H area remains $\overline{BUSY}$ and READY does not go back.
　　Avoid noise input, and at use, be sure to connect it to GND terminal or set it OPEN.

**6.Nov.2013 Rev.002**

6) Notes on power ON/OFF

・At power ON/OFF, set CS "L".
When CS is "H", this IC gets in input accept status (active). At power ON, set CS "L" to prevent malfunction from noise. (When CS is in "L" status, all inputs are cancelled.) At power decline low power status may prevail. Therefore, at power OFF, set CS "L" to prevent malfunction from noise.

Figure 50. Timing at power ON/OFF

(Bad example) CS pin is pulled up to Vcc.
In this case, CS becomes "H" (active status), EEPROM may malfunction or have write error due to noises. This is true even when CS input is High-Z.

(Good example) It is "L" at power ON/OFF.
Set 10ms or higher to recharge at power OFF.
When power is turned on without observing this condition, IC internal circuit may not be reset.

○POR citcuit
This IC has a POR (Power On Reset) circuit as a mistake write countermeasure. After POR operation, it gets in write disable status. The POR circuit is valid only when power is ON, and does not work when power is OFF. However, if CS is "H" at power ON/OFF, it may become write enable status owing to noises and the likes. For secure operation, observe the follwing conditions.

1. Set CS="L"
2. Turn on power so as to satisfy the recommended conditions of tR, tOFF, Vbot for POR circuit operation.

Figure 51. Rise waveform diagram

Recommended conditions of $t_R$, $t_{OFF}$, Vbot

| $t_R$ | $t_{OFF}$ | Vbot |
|---|---|---|
| 10ms or below | 10ms or higher | 0.3V or below |
| 100ms or below | 10ms or higher | 0.2V or below |

○LVCC circuit
LVCC (Vcc-Lockout) circuit prevents data rewrite operation at low power, and prevents wrong write.
At LVCC voltage (Typ.=1.9V) or below, it prevent data rewrite.

7) Noise countermeasures
○Vcc noise (bypass capacitor)
When noise or surge gets in the power source line, malfunction may occur, therefore, for removing these, it is recommended to attach a by pass capacitor (0.1μF) between IC Vcc and GND, At that moment, attach it as close to IC as possible.And, it is also recommended to attach a bypass capacitor between board Vcc and GND.
○SK noise
When the rise time (tR) of SK is long, and a certain degree or more of noise exists, malfunction may occur owing to clock bit displacement.
To avoid this, a Schmitt trigger circuit is built in SK input. The hysteresis width of this circuit is set about 0.3, if noises exist at SK input, set the noise amplitude 0.3p-p or below. And it is recommended to set the rise time (tR) of SK 100ns or below. In the case when the rise time is 100ns or higher, take sufficient noise countermeasures. Make the clock rise, fall time as small as possible.

●**Cautions on Use**

(1) Described numeric values and data are design representative values, and the values are not guaranteed.

(2) We believe that application circuit examples are recommendable, however, in actual use, confirm characteristics further sufficiently. In the case of use by changing the fixed number of external parts, make your decision with sufficient margin in consideration of static characteristics and transition characteristics and fluctuations of external parts and our IC.

(3) Absolute Maximum Ratings
If the absolute maximum ratings such as impressed voltage and operating temperature range and so forth are exceeded, IC may be destructed. Do not impress voltage and temperature exceeding the absolute maximum ratings. In the case of fear exceeding the absolute maximum ratings, take physical safety countermeasures such as fuses, and see to it that conditions exceeding the absolute maximum ratings should not be impressed to IC.

(4) GND electric potential
Set the voltage of GND terminal lowest at any operating condition. Make sure that each terminal voltage is not lower than that of GND terminal in consideration of transition status.

(5) Heat design
In consideration of allowable loss in actual use condition, carry out heat design with sufficient margin.

(6) Terminal to terminal shortcircuit and wrong packaging
When to package IC onto a board, pay sufficient attention to IC direction and displacement. Wrong packaging may destruct IC. And in the case of shortcircuit between IC terminals and terminals and power source, terminal and GND owing to foreign matter, IC may be destructed.

(7) Use in a strong electromagnetic field may cause malfunction, therefore, evaluate design sufficiently.

# Notice

## Precaution on using ROHM Products

1.  If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment <sup>(Note 1)</sup>, aircraft/spacecraft, nuclear power controllers, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

| JAPAN | USA | EU | CHINA |
|---|---|---|---|
| CLASSⅢ | CLASSⅢ | CLASSⅡb | CLASSⅢ |
| CLASSⅣ | | CLASSⅢ | |

2.  ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
    [a] Installation of protection circuits or other protective devices to improve system safety
    [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3.  Our Products are not designed under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
    [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
    [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
    [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including $Cl_2$, $H_2S$, $NH_3$, $SO_2$, and $NO_2$
    [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
    [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
    [f] Sealing or coating our Products with resin or other coating materials
    [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
    [h] Use of the Products in places subject to dew condensation

4.  The Products are not subject to radiation-proof design.

5.  Please verify and confirm characteristics of the final or mounted products in using the Products.

6.  In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7.  De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.

8.  Confirm that operation temperature is within the specified range described in the product specification.

9.  ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

## Precaution for Mounting / Circuit board design

1.  When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2.  In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

**Precautions Regarding Application Examples and External Circuits**
1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

**Precaution for Electrostatic**
This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

**Precaution for Storage / Transportation**
1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
    [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
    [b] the temperature or humidity exceeds those recommended by ROHM
    [c] the Products are exposed to direct sunshine or condensation
    [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

**Precaution for Product Label**
QR code printed on ROHM Products label is for ROHM's internal use only.

**Precaution for Disposition**
When disposing Products please dispose them properly using an authorized industry waste company.

**Precaution for Foreign Exchange and Foreign Trade act**
Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

**Precaution Regarding Intellectual Property Rights**
1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:

2. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

**Other Precaution**
1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

**General Precaution**

1.  Before you use our Pro ducts, you are requested to care fully read this document and fully understand its contents. ROHM shall n ot be in an y way responsible or liabl e for fa ilure, malfunction or acci dent arising from the use of a ny ROHM's Products against warning, caution or note contained in this document.

2.  All information contained in this docume nt is current as of the issuing date and subj ect to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the la test information with a ROHM sale s representative.

3.  The information contained in this doc ument is provi ded on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate an d/or error-free. ROHM shall not be in an y way responsible or liable for an y damages, expenses or losses incurred by you or third parties resulting from inaccur acy or errors of or concerning such information.
