### Description

The PT8A3230/1/2/3/4/5/6/7 is a mixed signal CMOS LSI chip designed for the automatic controller of heat with external NTC (Negative Temperature Component). NTC open protection is implemented for device safety. When NTC is open, it will cut off GATE output to disable heating, and the LED1 will flash at 1/8 CLK.

The device can be used in both 120V and 240V power line supplier, automatically adjusting the heating power according to the power line voltage to avoid heating appliance damage.

## Function Description

### State description

**Reset:** The device will be at reset state after power-on.

**Heating-on:** The device will be at heating-on state after heating-on button is pressed.

**Heating-off:** This device enters heating-off state after its power-on reset or heating timer timeout or heating-off button pressed.

### Timer

Once the device enters Heating-on state, internal timer start counting. It reaches timeout state and exit heating-on state after 216000 clock period, that is, the heating time is about 1 hour for 60Hz CLK signal, and 1.2 hour for 50Hz.

### Control signal output

When working in Heating-on state, GATE/LED output will be related to NTC input and CLK input amplitude.

### Effect of NTC and CLK input voltage on GATE and LED indication
