8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

Pin Descriptions

44 PINS		I/O†	DESCRIPTION
NAME	NO.		
A0 A1 A2 A3 A4 A5 A6 A7	20 19 18 17 16 15 13 12	I/O	Port A is a general-purpose bidirectional I/O port.
D3 D4/CP3 D6/CP4 D7/CP5	23 22 24 21	I/O	Port D is a general-purpose bidirectional port. Also configurable as SYSCLK (see Note 1) PACT input capture 3 (see Note 2) PACT input capture 4 (see Note 2) PACT input capture 5 (see Note 2)
CP1 CP2 CP6	40 36 34	I	PACT Input capture pin 1 PACT Input capture pin 2 PACT Input capture pin 3
AN0/E0 AN1/E1 AN2/E2 AN3/E3 AN4/E4 AN5/E5 AN6/E6 AN7/E7	25 26 27 28 30 31 32 33	I	ADC1 analog input pins (AN0–AN7)/port E digital input pins (E0–E7) Port E can be programmed individually as a general-purpose digital input pin if it is not used as ADC1 analog input or positive reference input.
INT1 INT2 INT3	7 8 9	I I/O I/O	External interrupt (non-maskable or maskable)/general-purpose input pin External maskable interrupt input/general purpose bidirectional pin External maskable interrupt input/general purpose bidirectional pin
OP1 OP2 OP3 OP4 OP5 OP6 OP7 OP8	42 43 44 1 2 3 4 5	O	PACT output pin 1 PACT output pin 2 PACT output pin 3 PACT output pin 4 PACT output pin 5 PACT output pin 6 PACT output pin 7 PACT output pin 8
SCIRXD SCITXD	35 41	I O	PACT mini SCI data receive input pin PACT mini SCI data transmit output pin
RESET	6	I/O	System reset bidirectional pin; as input pin, RESET initializes the microcontroller; as open-drain output, RESET indicates that an internal failure was detected by watchdog or oscillator fault circuit.
MC	39	I	Mode control input pin; enables EEPROM write protection override (WPO) mode, also EPROM V _{PP}
XTAL2/CLKIN XTAL1	38 37	I O	Internal oscillator crystal input/External clock source input Internal oscillator output for crystal
VCC1 VSS1 VCC3 VSS3	10 14 11 29		Positive supply voltage for digital logic and digital I/O pins Ground reference for digital logic and digital I/O pins ADC1 positive supply voltage and optional positive reference input ADC1 ground supply and low reference input pin

† I = input, O = output

- NOTES: 1. D3 can be configured as SYSCLK by appropriately programming the DPORT1 and DPORT2 registers.
2. These digital I/O buffers are connected internally to some of the PACT module's input capture pins. This allows the microcontroller to read the level on the input capture pin, or if the port D pin is configured as an output, to generate a capture. Be careful to leave the port D pin configured as an input if the corresponding input capture pin is being driven by external circuitry.

functional block diagram

description

The TMS370C032A, TMS370C332A, TMS370C732A, and SE370C732A devices are members of the TMS370 family of single-chip 8-bit microcontrollers. Unless otherwise noted, the term TMS370Cx32 refers to these devices. The TMS370 family provides cost-effective real-time system control through integration of advanced peripheral-function modules and various on-chip memory configurations.

The TMS370Cx32 family of devices is implemented using high-performance silicon-gate CMOS EPROM and EEPROM technologies. Low-operating power, wide-operating temperature range, and noise immunity of CMOS technology coupled with the high performance and extensive on-chip peripheral functions make the TMS370Cx32 devices attractive for system designs for automotive electronics, industrial motors, computer peripheral controls, telecommunications, and consumer applications.

All TMS370Cx32 devices contain the following on-chip peripheral modules:

- Programmable acquisition and control timer (PACT)
 - Asynchronous mini SCI
 - PACT watchdog timer
- Eight channel, 8-bit analog-to-digital converter 1 (ADC1)

TMS370Cx32 8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

description (continued)

Table 1 provides a memory configuration overview of the TMS370Cx32 devices.

Table 1. Memory Configurations

DEVICE	PROGRAM MEMORY (BYTES)		DATA MEMORY (BYTES)		44 PIN PACKAGES
	ROM	EPROM	RAM	EEPROM	
TMS370C032A	8K	—	256	256	FN – PLCC
TMS370C332A	8k	—	256	—	FN – PLCC
TMS370C732A	—	8K	256	256	FN – PLCC
SE370C732A†	—	8K	256	256	FZ – CLCC

† System evaluators and development are for use only in prototype environment, and their reliability has not been characterized.

The suffix letter (A) appended to the device names shown in the device column of Table 1 indicates the configuration of the device. ROM or EPROM devices have different configurations as indicated in Table 2. ROM devices with the suffix letter A are configured through a programmable contact during manufacture.

Table 2. Suffix Letter Configuration

DEVICE‡	CLOCK	LOW-POWER MODE
EPROM A	Divide-by-4 (Standard oscillator)	Enabled
ROM A	Divide-by-4 or Divide-by-1 (PLL)	Enabled or disabled

‡ Refer to the “device numbering conventions” section for device nomenclature and to the “device part numbers” section for ordering.

The 8K bytes of mask-programmable ROM in the associated TMS370Cx32 devices are replaced in the TMS370C732A with 8K bytes of EPROM. All other available memory and on-chip peripherals are identical except for the TMS370C332A which does not have EEPROM memory. The OTP (TMS370C732A) and reprogrammable (SE370C732A) devices are available.

The TMS370C732A OTP device is available in a plastic package. This microcontroller is effective to use for immediate production updates for other members of the TMS370Cx32 family or for low-volume production runs when the mask charge or cycle time for the low-cost mask ROM devices is not practical.

The SE370C732A has a windowed ceramic package to allow reprogramming of the program EPROM memory during the development/prototyping phase of design. The SE370C732A device allows quick updates to breadboards and prototype systems while iterating initial designs.

The TMS370Cx32 family provides two low-power modes (STANDBY and HALT) for applications where low-power consumption is critical. Both modes stop all CPU activity (that is, no instructions are executed). In the STANDBY mode, the internal oscillator, the PACT counter, and PACT’s first command/definition entry remain active. This allows the PACT module to bring the device out of STANDBY mode. In the HALT mode, all device activity is stopped. The device retains all RAM data and peripheral configuration bits throughout both low-power modes.

The TMS370Cx32 features advanced register-to-register architecture that allows direct arithmetic and logical operations without requiring an accumulator (for example, ADD R24, R47; add the contents of register 24 to the contents of register 47 and store the result in register 47). The TMS370Cx32 family is fully instruction-set-compatible, providing easy transition between members of the TMS370 8-bit microcontroller family.

The TMS370Cx32 has a PACT module that acts as a timer coprocessor by gathering timing information on input signals and controlling output signals with little or no intervention by the CPU. The coprocessor nature of this module allows for levels of flexibility and power not found in traditional microcontroller timers.

description (continued)

The TMS370Cx32 family provides the system designer with an economical, efficient solution to real-time control applications. The PACT compact development tool (CDT™) solves the challenge of efficiently developing the software and hardware required to design the TMS370Cx32 into an ever-increasing number of complex applications. The application source code can be written in assembly and C language, and the output code can be generated by the linker. Precise real-time, in-circuit emulation and extensive symbolic debug and analysis tools ensure efficient software and hardware implementation as well as a reduced time-to-market cycle.

The TMS370Cx32 family together with the TMS370 PACT CDT370, BP programmer, starter kit, software tools, the SE370C732A reprogrammable devices, comprehensive product documentation, and customer support provide a complete solution to the needs of the system designer.

central processing unit (CPU)

The CPU on the TMS370Cx32 device is the high-performance 8-bit TMS370 CPU module. The 'x32 implements an efficient register-to-register architecture that eliminates the conventional accumulator bottleneck. The complete 'x32 instruction map is shown in Table 15.

The '370Cx32 CPU architecture provides the following components:

CPU registers:

- A stack pointer (SP) that points to the last entry in the memory stack
- A status register (ST) that monitors the operation of the instructions and contains the global interrupt-enable bits
- A program counter (PC) that points to the memory location of the next instruction to be executed

A memory map that includes:

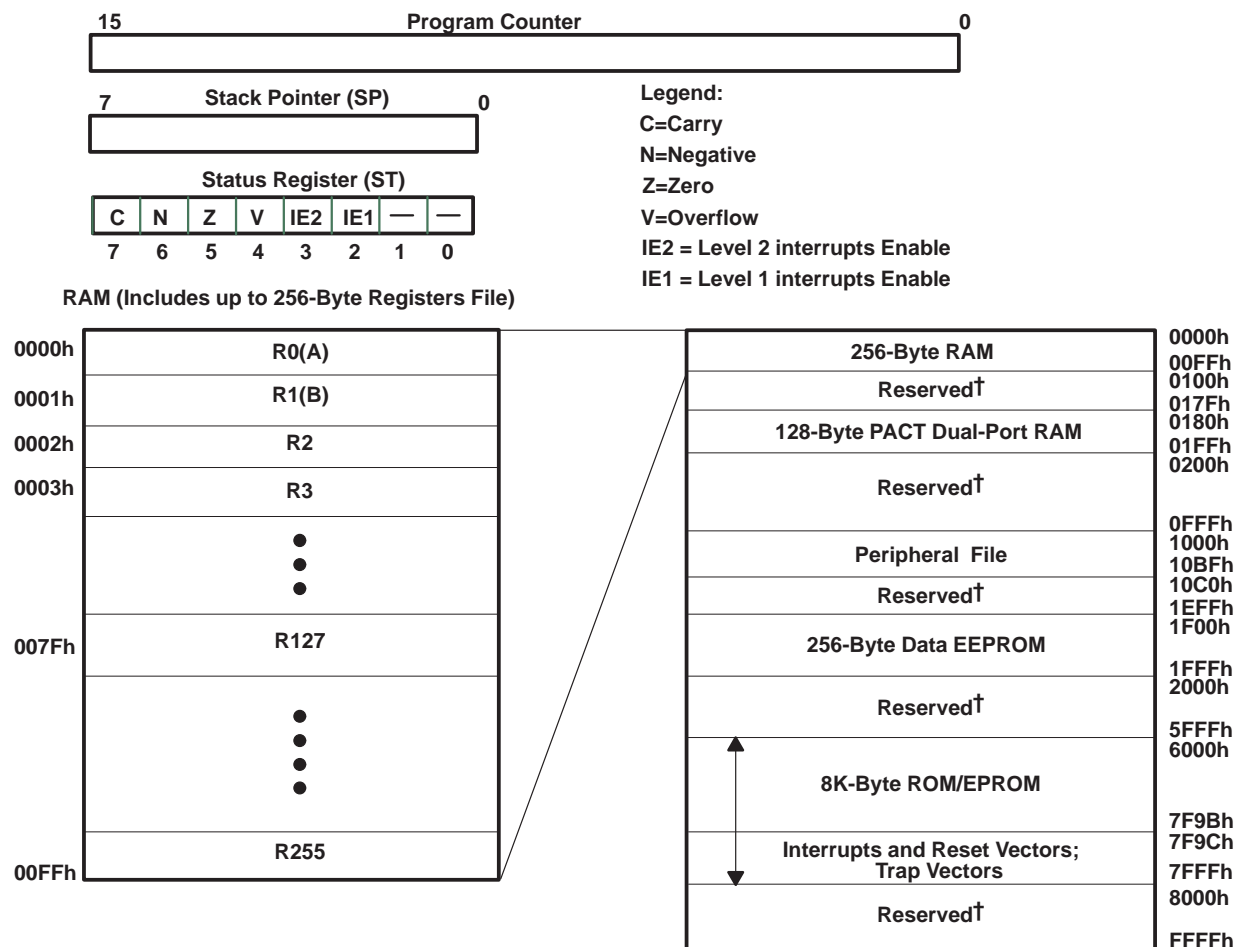

- 256-byte general-purpose RAM that can be used for data memory storage, program instructions, general purpose register, dual-port RAM, or the stack
- The upper 128-bytes of the register file is called dual-port RAM that contains the capture registers, the circular buffer, and a command/definition area.
- A peripheral file that provides access to all internal peripheral modules, system-wide control functions, and EEPROM/EPROM programming control
- 256-byte EEPROM module that provides in-circuit programmability and data retention in power-off conditions
- 8K-byte ROM or 8K-byte EPROM

TMS370Cx32 8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

central processing unit (CPU) (continued)

Figure 1 Illustrates the CPU registers and memory blocks.

† Reserved means the address space is reserved for future expansion.

Figure 1. Programmer's Model

stack pointer (SP)

The SP is an 8-bit CPU register. Stack operates as a last-in, first-out, read/write memory. Typically, the stack is used to store the return address on subroutine calls as well as the ST contents during interrupt sequences.

The SP points to the last entry or top of the stack. The SP is incremented automatically before data is pushed onto the stack and decremented after data is popped from the stack. The stack can be placed anywhere in the on-chip RAM.

status register (ST)

The ST monitors the operation of the instructions and contains the global interrupt-enable bits. The ST includes four status bits (condition flags) and two interrupt-enable bits.

- The four status bits indicate the outcome of the previous instruction; conditional instructions (for example, the conditional-jump instructions) use the status bits to determine program flow.
- The two interrupt-enable bits control the two interrupt levels.

central processing unit (CPU) (continued)

The ST, status-bit notation, and status-bit definitions are shown in Table 3.

Table 3. Status Registers

7	6	5	4	3	2	1	0
C	N	Z	V	IE2	IE1	Reserved	Reserved
RW-0	RW-0	RW-0	RW-0	RW-0	RW-0		

R = read, W = write, 0 = value after reset

program counter (PC)

The contents of the PC point to the memory location of the next instruction to be executed. The PC consists of two 8-bit registers in the CPU: the program counter high (PCH) and program counter low (PCL). These registers contain the most significant byte (MSbyte) and least significant byte (LSbyte) of a 16-bit address.

During reset, the contents of the reset vector (7FFEh, 7FFFh) are loaded into the PC. The PCH (MSbyte of the PC) is loaded with the contents of memory location 7FFEh, and the PCL (LSbyte of the PC) is loaded with the contents of memory location 7FFFh. Figure 2 shows this operation using an example value of 6000h as the contents of the reset vector.

Figure 2. Program Counter After Reset

memory map

The TMS370Cx32 architecture is based on the Von Neuman architecture, where the program memory and data memory share a common address space. All peripheral input/output is memory mapped in this same common address space. As shown in Figure 3, the TMS370Cx32 provides memory-mapped RAM, ROM, EPROM, data EEPROM, I/O pins, peripheral functions, and system-interrupt vectors.

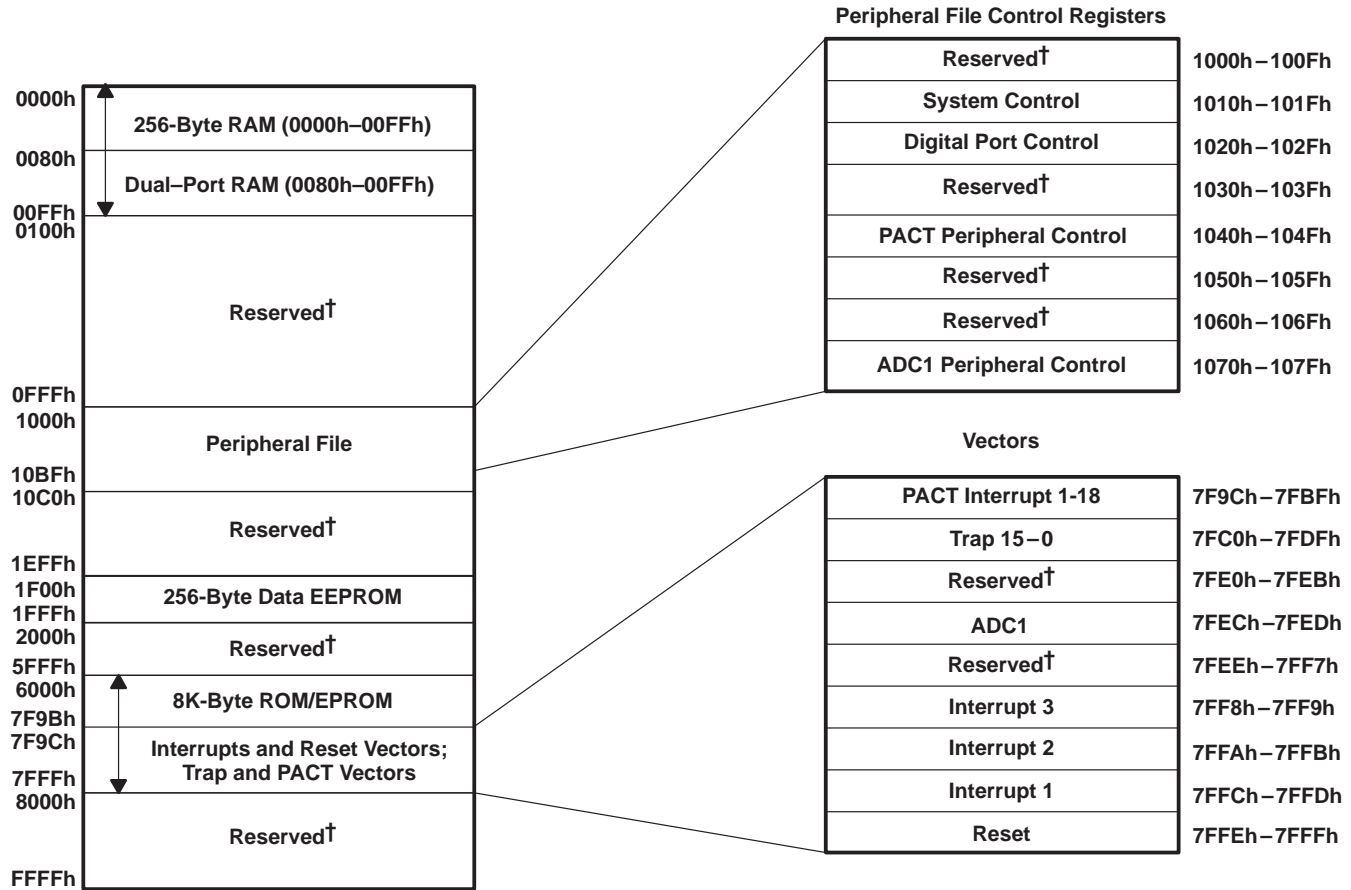

The peripheral file contains all I/O port control, peripheral status and control, EEPROM, EPROM, and system-wide control functions. The peripheral file is located between 1000h to 107Fh and is divided logically into eight peripheral file frames of 16 bytes each. The eight PF frames consist of five control frames and three reserved frames. Each on-chip peripheral is assigned to a separate frame through which peripheral control and data information is passed.

TMS370Cx32

8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

central processing unit (CPU) (continued)

† Reserved means that the address space is reserved for future expansion.

Figure 3. TMS370Cx32 Memory Map

RAM/register file (RF)

Locations within the RAM address space can serve as the RF, general-purpose read/write memory, program memory, or the stack instructions. The TMS370Cx32 devices contain 256 bytes of internal RAM, memory-mapped beginning at location 0000h (R0) and continuing through location 00FFh (R255) which is shown in Figure 1.

The first two registers, R0 and R1, are also called register A and B, respectively. Some instructions implicitly use register A or B; for example, the instruction LDSP (load SP) assumes that the value to be loaded into the stack pointer is contained in register B. Registers A and B are the only registers cleared on reset.

dual-port RAM

The upper 128 bytes of the register files (0080h – 00FFh) can be used by the PACT module to contain commands and definitions as well as timer values. Any RAM not used by PACT can be used as additional CPU register or as general-purpose memory.

peripheral file (PF)

The TMS370Cx32 control registers contain all the registers necessary to operate the system and peripheral modules on the device. The instruction set includes some instructions that access the PF directly. These instructions designate the register by the number of the PF relative to 1000h, preceded by P0 for a hexadecimal designator or P for a decimal designator. For example, the system-control register 0 (SCCR0) is located at address 1010h; its peripheral file hexadecimal designator is P010, and its decimal designator is P16. Table 4 shows the TMS370Cx32 PF address map.

Table 4. TMS370Cx32 Peripheral File Address Map

ADDRESS RANGE	PERIPHERAL FILE DESIGNATOR	DESCRIPTION
1000h–100Fh	P000–P00F	Reserved
1010h–101Fh	P010–P01F	System and EPROM/EEPROM control registers
1020h–102Fh	P020–P02F	Digital I/O port control registers
1030h–103Fh	P030–P03F	Reserved
1040h–104Fh	P040–P04F	PACT registers
1050h–106Fh	P050–P06F	Reserved
1070h–107Fh	P070–P07F	Analog-to-digital converter 1 registers
1080h–10FFh	P080–P0FF	Reserved

data EEPROM

The TMS370Cx32 devices, containing 256 bytes of data EEPROM, have a memory that is mapped beginning at location 1F00h and continuing through location 1FFFh. Writing to the data EEPROM module is controlled by the data EEPROM control register (DEECTL) and the write-protection register (WPR). Programming algorithm examples are available in the *TMS370 Family User's Guide* (literature number SPNU127) or the *TMS370 Family Data Manual* (literature number SPNS014B). The data EEPROM features include the following:

- Programming:
 - Bit-, byte-, and block-write/erase modes
 - Internal charge pump circuitry. No external EEPROM programming voltage supply is needed.
 - Control register: Data EEPROM programming is controlled by the DEECTL located in the PF frame beginning at location P01A. See Table 5.
 - In-circuit programming capability. There is no need to remove the device to program it.
- Write protection. Writes to the data EEPROM are disabled during the following conditions.
 - Reset. All programming of the data EEPROM module is halted.
 - Write protection active. There is one write-protect bit per 32-byte EEPROM block.
 - Low-power mode operation
- Write protection can be overridden by applying 12 V to MC.

Table 5. Data EEPROM and PROGRAM EPROM Control Registers Memory Map

ADDRESS	SYMBOL	NAME
P01A	DEECTL	Data EEPROM Control Register
P01B	—	Reserved
P01C	EPCTLL	Program EPROM Control Register – Low Array

TMS370Cx32

8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

program EPROM†

The TMS370C732 device contains 8K bytes of EPROM mapped, beginning at location 6000h and continuing through location 7FFFh as shown in Figure 3. Reading the program EPROM modules is identical to reading other internal memory. During programming, the EPROM is controlled by the EPROM control register (EPCTLL). The program EPROM module features include:

- Programming
 - In-circuit programming capability if V_{PP} is applied to MC
 - Control register: EPROM programming is controlled by the EPROM control register (EPCTLL) located in the peripheral file (PF) frame at location P01C as shown in Table 5.
- Write protection: Writes to the program EPROM are disabled under the following conditions:
 - Reset: All programming to the EPROM module is halted
 - Low-power modes
 - 13 V not applied to MC

program ROM†

The program ROM consists of 8K bytes of mask programmable read-only memory. The program ROM is used for permanent storage of data or instructions. Programming of the mask ROM is performed at the time of device fabrication. Refer to Figure 3 for ROM memory map.

system reset

The system-reset operation ensures an orderly start-up sequence for the TMS370Cx32 CPU-based device. There are up to three different actions that can cause a system reset to the device. Two of these actions are generated internally, while one ($\overline{\text{RESET}}$ pin) is controlled externally. These actions are as follows:

- PACT watchdog (WD) timer. A watchdog-generated reset occurs if an improper value is written to the WD key register, or if the re-initialization does not occur before the watchdog timer timeout. See the *TMS370 Family User's Guide* (literature number SPNU127) for more information.
- Oscillator reset. Reset occurs when the oscillator operates outside of the recommended operating range. See the *TMS370 Family User's Guide* (literature number SPNU127) for more information.
- External $\overline{\text{RESET}}$ pin. A low level signal can trigger an external reset. To ensure a reset, the external signal should be held low for one SYSCLK cycle. Signals of less than one SYSCLK can generate a reset. See the *TMS370 Family User's Guide* (literature number SPNU127) for more information.

Once a reset source is activated, the external $\overline{\text{RESET}}$ pin is driven (active) low for a minimum of eight SYSCLK cycles. This allows the 'x32 device to reset external system components. Additionally, if a cold start condition (V_{CC} is off for several hundred milliseconds) or oscillator failure occurs or the $\overline{\text{RESET}}$ pin is held low, then the reset logic holds the device in a reset state for as long as these actions are active.

After a reset, the program can check the oscillator-fault flag (OSC FLT FLAG, SCCR0.4) and the cold-start flag (COLD START, SCCR0.7) to determine the source of the reset. A reset does not clear these flags. Table 6 depicts the reset sources. If none of the sources indicated in Table 1 caused the reset, then the $\overline{\text{RESET}}$ pin was pulled low by the external hardware or the PACT module's watchdog.

† Memory addresses 7FE0h through 7FEBh are reserved for Texas Instruments, and 7FEC through 7FFFh are reserved for interrupt and reset vectors. Trap vectors, used with TRAP0 through TRAP15 instructions are located between addresses 7FC0h and 7FDf. PACT interrupts are located between addresses 7F9Ch and 7FBFh.

system reset (continued)

Table 6. Reset Sources

REGISTER	ADDRESS	PF	BIT NO.	CONTROL BIT	SOURCE OF RESET
SCCR0	1010h	P010	7	COLD START	Cold (power-up)
SCCR0	1010h	P010	4	OSC FLT FLAG	Oscillator out of range

Once a reset is activated, the following sequence of events occurs:

1. The CPU registers are initialized: ST = 00h, SP = 01h (reset state).
2. Registers A and B are initialized to 00h (no other RAM is changed).
3. The contents of the LSbyte of the reset vector (07FFh) are read and stored in the PCL.
4. The contents of the MSbyte of the reset vector (07FEh) are read and stored in the PCH.
5. Program execution begins with an opcode fetch from the address pointed to the PC.

The reset sequence takes 20 SYSCLK cycles from the time the reset pulse is released until the first opcode fetch. During a reset, RAM contents (except for registers A and B) remain unchanged, and the module control register bits are initialized to their reset state.

TMS370Cx32 8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

interrupts

The TMS370 family software-programmable interrupt structure permits flexible on-chip and external interrupt configurations to meet real-time interrupt-driven application requirements. The hardware interrupt structure incorporates two priority levels as shown in Figure 4. Interrupt level 1 has a higher priority than interrupt level 2. The two priority levels can be masked independently by the global interrupt mask bits (IE1 and IE2) of the ST.

Figure 4. Interrupt Control

Each system interrupt is configured independently to either the high- or low-priority chain by the application program during system initialization. Within each interrupt chain, the interrupt priority is fixed by the position of the system interrupt. However, since each system interrupt is selectively configured on either the high- or low-priority-interrupt chain, the application program can elevate any system interrupt to the highest priority. Arbitration between the two priority levels is performed within the CPU. Arbitration within each of the priority

interrupts (continued)

chains is performed within the peripheral modules to support interrupt expansion for future modules. Pending interrupts are serviced upon completion of current instruction execution, depending on their interrupt mask and priority conditions.

The TMS370Cx32 has 22 hardware system interrupts (plus $\overline{\text{RESET}}$) as shown in Table 7. Each system interrupt has a dedicated vector located in program memory through which control is passed to the interrupt service routines. A system interrupt may have multiple interrupt sources. All the interrupt sources are individually maskable by local interrupt enable control bits in the associated peripheral file. Each interrupt source FLAG bit is individually readable for software polling or for determining which interrupt source generated the associated system interrupt.

Nineteen of the system interrupts are generated by on-chip peripheral functions, and three external interrupts are supported. Software configuration of the external interrupts is performed through the INT1, INT2, and INT3 control registers in peripheral file frame 1. Each external interrupt is individually software configurable for input polarity (rising or falling edge) for ease of system interface. External interrupt INT1 is software configurable as either a maskable or non-maskable interrupt. When INT1 is configured as non-maskable, it cannot be masked by the individual- or global-enable mask bits. The INT1 NMI bit is protected during non-privileged operation and, therefore, should be configured during the initialization sequence following reset. To maximize pin flexibility, external interrupts INT2 and INT3 can be software configured as general-purpose input/output pins if the interrupt function is not required (INT1 can be similarly configured as an input pin).

privileged operation and EEPROM write protection override

The TMS370Cx32 family is designed with significant flexibility to enable the designer to software-configure the system and peripherals to meet the requirements of a variety of applications. The nonprivileged mode of operation ensures the integrity of the system configuration, once it is defined for an application. Following a hardware reset, the TMS370Cx32 operates in the privileged mode, where all peripheral file registers have unrestricted read/write access, and the application program configures the system during the initialization sequence following reset. As the last step of system initialization, the PRIVILEGE DISABLE bit (SCCR2.0) is set to 1 to enter the nonprivileged mode, disabling write operations to specific configuration-control bits within the PF. Table 8 displays the system-configuration bits which are write-protected during the nonprivileged mode and must be configured by software prior to exiting the privileged mode.

† The privilege bits are shown in a bold typeface in the peripheral file frame 1 section.

low-power and IDLE modes

The TMS370Cx32 devices have two low-power modes (STANDBY and HALT) and an IDLE mode. For mask-ROM devices, low-power modes can be disabled permanently through a programmable contact at the time when the mask is manufactured.

The STANDBY and HALT low-power modes significantly reduce power consumption by reducing or stopping the activity of the various on-chip peripherals when processing is not required. Each of the low-power modes is entered by executing the IDLE instruction when the PWRDWN/IDLE bit in SCCR2 has been set to 1. The HALT/STANDBY bit in SCCR2 controls the low-power mode selection.

In the STANDBY mode (HALT/STANDBY = 0), all CPU activity and most peripheral module activity is stopped; however, the oscillator, internal clocks, the PACT counter, and the first PACT command entry remain active in all modules. System processing is suspended until a qualified interrupt (hardware $\overline{\text{RESET}}$ or external interrupt on INT1, INT2, or INT3) is detected.

In the HALT mode (HALT/STANDBY = 1), the TMS370Cx32 is placed in its lowest power consumption mode. The oscillator and internal clocks are stopped, causing all internal activity to be halted. System activity is suspended until a qualified interrupt (hardware $\overline{\text{RESET}}$ or external interrupt on the INT1, INT2, or INT3) is detected. The power-down mode-selection bits are summarized in Table 9.

low-power and IDLE modes (continued)

Table 9. Low-Power/Idle Control Bits

POWER-DOWN CONTROL BITS		MODE SELECTED
PWRDWN/IDLE (SCCR2.6)	HALT/STANDBY (SCCR2.7)	
1	0	STANDBY
1	1	HALT
0	X †	IDLE

† X = don't care

When low-power modes are disabled through a programmable contact in the mask-ROM devices, writing to the SCCR2.6-7 bits is ignored. In addition, if an IDLE instruction is executed when low-power modes are disabled through a programmable contact, the device always enters the IDLE mode.

To provide a method for always exiting low-power modes for mask-ROM devices, INT1 is enabled automatically as a nonmaskable interrupt (NMI) during low-power modes when the hard watchdog mode is selected. This means that the NMI is generated always, regardless of the interrupt enable flags.

The following information is preserved throughout both the STANDBY and HALT modes: RAM (register file), CPU registers (SP, PC, and ST), I/O pin direction and output data, and status registers of all on-chip peripheral functions. Since all CPU instruction processing is stopped during the STANDBY and HALT modes, the clocking of the WD timer is inhibited.

clock modules

The 'x32 family provides two clock options that are referred to as divide-by-1 (phase-locked loop) and divide-by-4 (standard oscillator). Both the divide-by-1 and divide-by-4 options are configurable during the manufacturing process of a TMS370 microcontroller. The 'x32 masked-ROM devices offer both options to meet system engineering requirements. Only one of the two clock options is allowed on each ROM device. The '732A EPROM has only the divide-by-4.

The divide-by-1 clock module option provides the capability for reduced electromagnetic interference (EMI) with no added cost.

The divide-by-1 provides a one-to-one match of the external resonator frequency (CLKIN) to the internal system clock (SYSCLK) frequency, whereas the divide-by-4 produces a SYSCLK which is one-fourth the frequency of the external resonator. Inside the divide-by-1 module, the frequency of the external resonator is multiplied by four, and the clock module then divides the resulting signal by four to provide the four-phased internal system clock signals. The resulting SYSCLK is equal to the resonator frequency. These are formulated as follows:

$$\text{Divide-by-4 option : } \text{SYSCLK} = \frac{\text{external resonator frequency}}{4} = \frac{\text{CLKIN}}{4}$$

$$\text{Divide-by-1 option : } \text{SYSCLK} = \frac{\text{external resonator frequency} \times 4}{4} = \text{CLKIN}$$

The main advantage of choosing a divide-by-1 oscillator is the reduced EMI. The harmonics of low-speed resonators extend through fewer of the emissions spectrum than the harmonics of faster resonators. The divide-by-1 provides the capability of reducing the resonator speed by four times, and this results in a steeper decay of emissions produced by the oscillator.

system configuration registers

Table 10, contains system-configuration and control functions and registers for controlling EEPROM programming. The privileged bits are shown in a bold typeface and shaded areas.

programmable acquisition and control timer (PACT) module

Traditionally, timers in microcontrollers provide limited capture and compare functions consuming significant CPU processing power, leading to inaccurate timings due to interrupt latencies. The programmable acquisition and control timer (PACT8) acts as a coprocessor combining configurable capture and compare features, within a flexible dual-port RAM, able to run real-time tasks with little or no CPU intervention. The PACT structure allows concatenation of tasks, thus enabling the CPU to perform data manipulation while the PACT module both captures and outputs real-time-related information. Since all the PACT control information is held within the dual-port RAM, the CPU can access these parameters quickly.

To use the PACT, the user must set up three distinct areas of memory. The first is the dual-port RAM, which contains the capture area, the commands, and the timer definitions. The second is the peripheral frame. The third is an area near the end of the program memory which holds the interrupt vectors of PACT.

programmable acquisition and control timer (PACT) module (continued)

The PACT module features include the following:

- Input-capture functions on up to six input pins (CP1 to CP6), depending on the mode selected:
 - Mode A: CP1–2 are dedicated capture, CP3–6 are circular-buffer capture, and CP6 is an event pin.
 - Mode B: CP1–4 are dedicated capture, CP5–6 are circular-buffer capture, and CP6 is an event pin.
- Multiple timer-driven outputs on eight pins (OP1 to OP8)
 - Standard compare command: sets or clears an output pin whenever the timer/counter is equal to a certain value
 - Virtual timers: Enable variations of the PWM's period and provides periodic interrupts to the processor.
 - Double event-compare command: Comparisons of the 8-bit event counter with two event-compare values and the actions that can be performed are based on each value.
 - Event-compare 1 matching the event counter: sets or resets the selected output pin (OP1–OP8), generates interrupt, and generates a 32-bit capture into the circular buffer.
 - Event-compare 2 matching the event counter: sets or resets the selected output pin (OP1–OP8), generates interrupt, generates a 32-bit capture into the circular buffer, and resets the 20-bit default timer.
 - Offset timer definition-time from last event:
 - Generates an interrupt when the maximum event count is reached
 - Stores the 16-bit virtual timer in the circular buffer on each event
 - Stores the 20-bit default timer and 8-bit event counter in the circular buffer when the maximum event count is reached
 - Resets the 20-bit hardware default timer when the maximum event count is reached
 - Conditional-compare command has a timer-compare value and an event-compare value.
 - Generates an interrupt when the event-compare value equals the event counter and the timer-compare value equals the last defined timer
 - Sets or clears one of the seven output pins (OP1–OP7) when the event compare value equals the event counter and the timer-compare value equals the last defined timer
 - Baud rate timer definition: runs the mini-serial communications port built into the PACT module.
- Configurable timer overflow rates
- One 8-bit event counter driven by CP6
- Up to 20-bit timer capability
- Interaction between event counter and timer activity
- Register-based organization allowing direct access to timer parameters by the CPU
- 18 independent interrupt vectors with two priority levels
- Integrated, configurable watchdog with selectable time-out period

TMS370Cx32 8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

programmable acquisition and control timer (PACT) module (continued)

- Mini-serial communications interface works as a simplified full duplex universal asynchronous receiver/transmitter (UART) with independent setup of baud rate for receive and transmit lines.

- Asynchronous communications mode

$$\text{Asynchronous Baud} = \frac{1}{(\text{Max Virtual Timer Value}) \times (4) \times (\text{PACT Resolution})} \times \text{SYSCLK}$$

where PACT Resolution = SYSCLK × Prescale Value

analog-to-digital converter 1 module

The analog-to-digital converter 1 (ADC1) module is an 8-bit, successive approximation converter with internal sample-and-hold circuitry. The module has four multiplexed analog input channels that allow the processor to convert the voltage levels from up to eight different sources. The ADC1 module features include the following:

- Minimum conversion time: 32.8 μ s at 5 MHz SYSCLK
- Ten external pins:
 - Eight analog-input channels (AN0–AN7), any of which can be software-configured as digital inputs (E0–E7) when not needed as analog channels
 - AN1–AN7 also can be configured as positive-input voltage reference.
 - V_{CC3} : ADC1 module high-voltage reference input
 - V_{SS3} : ADC1 module low-voltage reference input
- The ADDATA register, which contains the digital result of the last ADC1 conversion.
- ADC1 operations can be accomplished through either interrupt-driven or polled algorithms.
- Six ADC1 module control registers located in the control-register frame beginning at address 1070h

The ADC1 module control registers are listed in Table 14.

instruction set overview

Table 15 provides an opcode to instruction cross reference of all 73 instructions and 274 opcodes of the '370Cx32 instruction set. The numbers at the top of this table represent the most significant nibble (MSN) of the opcode while the numbers at the left side of the table represent the least significant nibble (LSN). The instruction of these two opcode nibbles contains the mnemonic, operands, and byte/cycle particular to that opcode.

For example, the opcode B5h points to the CLR A instruction. This instruction contains one byte and executes in eight SYSCLK cycles.

development system support

The TMS370 family development support tools include an assembler, a C-compiler, a linker, a starter kit, CDT and an EEPROM/UVEPROM programmer.

- Assembler/linker (Part No. TMDS3740850–02 for PC)
 - Includes extensive macro capability
 - Provides high-speed operation
 - Includes format conversion utilities for popular formats
- ANSI C Compiler (Part No. TMDS3740855–02 for PC, Part No. TMDS3740555–09 for HP700™, Sun-3™ or Sun-4™)
 - Generate assembly code for the TMS370 that can be inspected easily
 - Improves code execution speed and reduces code size with optional optimizer pass
 - Enables direct reference to the TMS370's port registers by using a naming convention
 - Provides flexibility in specifying the storage for data objects
 - Interfaces C functions and assembly functions easily
 - Includes assembler and linker
- CDT370 (Compact Development Tool) PACT real-time in-circuit emulation
 - Base (Part Number EDSCDT37P – for PC, requires cable)
 - Cable for 44-pin PLCC (Part No. EDSTRG44PLCC32)
 - EEPROM and EPROM programming support
 - Allows inspection and modification of memory locations
 - Includes compatibility to upload/download program and data memory
 - Execute programs and software routines
 - Includes 1024-sample trace buffer
 - Includes single-step executable instructions
 - Uses software breakpoints to halt program execution at selected address
- Microcontroller programmer
 - Base (Part No. TMDS3760500A – for PC, requires programmer head)
 - Single unit head for 44-pin PLCC (Part No. TMDS3780510A)
 - PC-based, window/function-key-oriented user interface for ease of use and rapid learning environment
- Starter Kit (Part No. TMDS37000 – For PC)
 - Includes TMS370 Assembler diskette and documentation
 - Includes TMS370 Simulator
 - Includes programming adapter board and programming software
 - Does not include – (to be supplied by the user):
 - + 5 V power supply
 - ZIF sockets
 - 9-pin RS-232 cable

device numbering conventions

Figure 7 illustrates the numbering and symbol nomenclature for the TMS370Cx32 family.

Figure 7. TMS370Cx32 Family Nomenclature

device part numbers

Table 16 lists all the 'x32 devices available. The device part number nomenclature is designed to assist ordering. Upon ordering, the customer must specify not only the device part number, but also the clock and watchdog timer options desired. Each device can have only one of the three possible watchdog timer options and one of the two clock options. The options to be specified pertain solely to orders involving ROM devices.

Table 16. Device Part Numbers

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC1} (see Note 3)	–0.6 V to 7 V
Input voltage range, All pins except MC	–0.6 V to 7 V
MC	–0.6 V to 14 V
Input clamp current, I_{IK} ($V_I < 0$ or $V_I > V_{CC1}$)	±20 mA
Output clamp current, I_{OK} ($V_O < 0$ or $V_O > V_{CC1}$)	±20 mA
Continuous output current per buffer, I_O ($V_O = 0$ to V_{CC1}) (see Note 4)	±10 mA
Maximum I_{CC} current	170 mA
Maximum I_{SS} current	–170 mA
Continuous power dissipation	800 mW
Operating free-air temperature, T_A : L version	0°C to 70°C
A version	–40°C to 85°C
T version	–40°C to 105°C
Storage temperature range, T_{stg}	–65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 3. Unless otherwise noted, all voltage values are with respect to V_{SS1} .

4. Electrical characteristics are specified with all output buffers loaded with specified I_O current. Exceeding the specified I_O current in any buffer can affect the levels on other buffers.

			0.3 V < V _I ≤ 13 V		650	
		I/O pins	12 V ≤ V _I ≤ 13 V†		50	mA
			0 V ≤ V _I ≤ V _{CC1}		± 10	
I _{OL}	Low-level output current	V _{OL} = 0.4 V	1.4			mA
I _{OH}	High-level output current	V _{OH} = 0.9 V _{CC1}	-50			μA
		V _{OH} = 2.4 V	-2			mA
I _{CC1}	Supply current (operating mode) OSC POWER bit = 0	See Notes 6 and 7 SYSCLK = 5 MHz		35	45	mA
		See Notes 6 and 7 SYSCLK = 3 MHz		25	35	
		See Notes 6 and 7 SYSCLK = 0.5 MHz		10	14	
	Supply current (STANDBY mode) OSC POWER bit = 0	See Notes 6 and 7 SYSCLK = 5 MHz		12	17	mA
		See Notes 6 and 7 SYSCLK = 3 MHz		8	13	
		See Notes 6 and 7 SYSCLK = 0.5 MHz		3	4	
	Supply current (STANDBY mode) OSC POWER bit = 1	See Notes 6 and 7 SYSCLK = 3 MHz		6	8.6	mA
		See Notes 6 and 7 SYSCLK = 0.5 MHz		2	3.0	
	Supply current (HALT mode)	See Note 6 XTAL2/CLKIN < 0.2 V		15	40	μA

† Input current I_{pp} will be a maximum of 50 mA only when programming EPROM.

NOTES: 6. Single chip mode, ports configured as inputs or outputs with no load. All inputs ≤ 0.2 V or ≥ V_{CC} - 0.2V.

7. XTAL2/CLKIN is driven with an external square-wave signal with 50% duty cycle and rise and fall times less than 10 ns. Current can be higher with a crystal oscillator. At 5-MHz SYSCLK, this extra current = 0.01 mA x (total load capacitance + crystal capacitance in pF).

- NOTES: A. The values of C1 and C2 are typically 15 pF and C3 value is typically 50 pF. See the manufacturer's recommendations for ceramic resonators.
B. The crystal/ceramic resonator frequency is four times the reciprocal of the system clock period.

Figure 9. Recommended Crystal/Clock Connections

- Case 1: $V_O = V_{OH} = 2.4 \text{ V}$; Load Voltage = 0 V
Case 2: $V_O = V_{OL} = 0.4 \text{ V}$; Load Voltage = 2.1 V

NOTE A: All measurements are made with the pin loading as shown unless otherwise noted. All measurements are made with XTAL2/CLKIN driven by an external square wave signal with a 50% duty cycle and rise and fall times less than 10 ns unless otherwise stated.

Figure 10. Typical Output Load Circuit (See Note A)

Figure 11. Typical Buffer Circuitry

TMS370Cx32 8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

PARAMETER MEASUREMENT INFORMATION

timing parameter symbology

Timing parameter symbols have been created in accordance with JEDEC Standard 100. In order to shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

AR	Array	PGM	Program
B	Byte	SC	SYSCLK
Cl	XTAL2/CLKIN		

Lowercase subscripts and their meanings are:

c	cycle time (period)	su	setup time
d	delay time	v	valid time
f	fall time	w	pulse duration (width)
r	rise time		

The following additional letters are used with these meanings:

H	High
L	Low
V	Valid

All timings are measured between high and low measurement points as indicated in Figure 12 and Figure 13.

Figure 12. XTAL2/CLKIN Measurement Points

Figure 13. General Measurement Points

external clocking requirements for clock divided by 4 (see Note 8 and Figure 14)

NO.	PARAMETER	MIN	MAX	UNIT
1	$t_w(\text{Cl})$ Pulse duration, XTAL2/CLKIN (see Note 9)	20		ns
2	$t_r(\text{Cl})$ Rise time, XTAL2/CLKIN		30	ns
3	$t_f(\text{Cl})$ Fall time, XTAL2/CLKIN		30	ns
4	$t_d(\text{ClH-SCL})$ Delay time, XTAL2/CLKIN rise to SYSCLK fall		100	ns
	CLKIN Crystal operating frequency	2	20	MHz
	SYSCLK Internal system clock operating frequency [†]	0.5	5	MHz

[†] SYSCLK = CLKIN/4

NOTES: 8. For V_{IL} and V_{IH} , refer to recommended operating conditions.

9. This pulse may be either a high pulse, as illustrated below, which extends from the earliest valid high to the final valid high in an XTAL2/CLKIN cycle or a low pulse, which extends from the earliest valid low to the final valid low in an XTAL2/CLKIN cycle.

Figure 14. External Clock Timing for Divide-by-4

external clocking requirements for clock divided by 1 (PLL) (see Note 8 and Figure 15)

NO.	PARAMETER	MIN	MAX	UNIT
1	$t_w(\text{Cl})$ Pulse duration, XTAL2/CLKIN (see Note 9)	20		ns
2	$t_r(\text{Cl})$ Rise time, XTAL2/CLKIN		30	ns
3	$t_f(\text{Cl})$ Fall time, XTAL2/CLKIN		30	ns
4	$t_d(\text{ClH-SCH})$ Delay time, XTAL2/CLKIN rise to SYSCLK rise		100	ns
	CLKIN Crystal operating frequency	2	5	MHz
	SYSCLK Internal system clock operating frequency [‡]	2	5	MHz

[‡] SYSCLK = CLKIN/1

NOTES: 8. For V_{IL} and V_{IH} , refer to recommended operating conditions.

9. This pulse can be either a high pulse, as illustrated below, which extends from the earliest valid high to the final valid high in an XTAL2/CLKIN cycle or a low pulse, which extends from the earliest valid low to the final valid low in an XTAL2/CLKIN cycle.

switching characteristics and timing requirements (see Note 10 and Figure 16)

NO.	PARAMETER		MIN	MAX	UNIT	
5	t_c	Cycle time, SYSCLK (system clock)	Divide-by-4	200	2000	ns
			Divide-by-1	200	500	
6	$t_w(\text{SCL})$	Pulse duration, SYSCLK low	$0.5 t_c - 20$	$0.5 t_c$	ns	
7	$t_w(\text{SCH})$	Pulse duration, SYSCLK high	$0.5 t_c$	$0.5 t_c + 20$	ns	

NOTE 10: t_c = system clock cycle time = $1/\text{SYSCLK}$

Figure 16. SYSCLK Timing

general purpose output signal switching time requirements (see Figure 17)

	MIN	NOM	MAX	UNIT
t_r Rise time		30		ns
t_f Fall time		30		ns

Figure 17. Signal Switching Timing

recommended EEPROM timing requirements for programming

	MIN	MAX	UNIT
$t_w(\text{PGM})B$ Pulse duration, programming signal to ensure valid data is stored (byte mode)	10		ms
$t_w(\text{PGM})AR$ Pulse duration, programming signal to ensure valid data is stored (array mode)	20		ms

recommended EPROM operating conditions for programming

	MIN	NOM	MAX	UNIT
V_{CC} Supply voltage	4.75	5.5	6	V
V_{PP} Supply voltage at MC pin	13	13.2	13.5	V
I_{PP} Supply current at MC pin during programming ($V_{PP} = 13\text{ V}$)		30	50	mA
SYSCLK System clock	Divide-by-4	0.5	5	MHz
	Divide-by-1	2	5	

recommended EPROM timing requirements for programming

	MIN	NOM	MAX	UNIT
$t_w(\text{EPGM})$ Pulse duration, programming signal (see Note 11)	0.40	0.50	3	ms

NOTE 11: Programming pulse is active when both EXE (EPCTL.0) and V_{PPS} (EPCTL.6) are set.

ADC1 converter

The ADC1 converter has a separate power bus for its analog circuitry. These pins are referred to as V_{CC3} and V_{SS3} . The purpose is to enhance ADC1 performance by preventing digital switching noise of the logic circuitry that can be present on V_{SS1} and V_{CC1} from coupling into the ADC1 analog stage. All ADC1 specifications are given with respect to V_{SS3} unless otherwise noted.

Resolution 8-bits (256 values)
 Monotonic Yes
 Output conversion mode 00h to FFh (00 for $V_I \leq V_{SS3}$; FF for $V_I \leq V_{ref}$)
 Conversion time (excluding sample time) $164 t_c$

recommended operating conditions

	MIN	NOM	MAX	UNIT
V_{CC3} Analog supply voltage	4.5	5	5.5	V
	$V_{CC1}-0.3$		$V_{CC1}+0.3$	
V_{SS3} Analog ground	$V_{SS1}-0.3$		$V_{SS1}+0.3$	V
V_{ref} Non- V_{CC3} reference†	2.5	V_{CC3}	$V_{CC3} + 0.1$	V
Analog input for conversion	V_{SS3}		V_{ref}	V

† V_{ref} must be stable, within $\pm 1/2$ LSB of the required resolution, during the entire conversion time.

operating characteristics over recommended ranges operating conditions

PARAMETER		MIN	MAX	UNIT
Absolute accuracy‡	$V_{CC3} = 5.5$ V $V_{ref} = 5.1$ V		± 1.5	LSB
Differential/integral linearity error‡§	$V_{CC3} = 5.5$ V $V_{ref} = 5.1$ V		± 0.9	LSB
I_{CC3} Analog supply current	Converting		2	mA
	Nonconverting		5	μ A
I_I Input current, AN0–AN7	0 V $\leq V_I \leq 5.5$ V		2	μ A
I_{ref} Input charge current			1	mA
Z_{ref} Source impedance of V_{ref}	$SYSCLK \leq 3$ MHz		24	k Ω
	3 MHz $< SYSCLK \leq 5$ MHz		10	k Ω

‡ Absolute resolution = 20 mV. At $V_{ref} = 5$ V, this is one LSB. As V_{ref} decreases, LSB size decreases; therefore, the absolute accuracy and differential/integral linearity errors in terms of LSBs increase.

§ Excluding quantization error of 1/2 LSB

TMS370Cx32 8-BIT MICROCONTROLLER

SPNS015C – FEBRUARY 1990 – REVISED FEBRUARY 1997

ADC1 converter (continued)

The ADC1 module allows complete freedom in design of the sources for the analog inputs. The period of the sample time is user-defined so that the high-impedance can be accommodated without penalty to the low-impedance sources. The sample period begins when the SAMPLE START bit of the ADC1 control register (ADCTL.6) is set to 1. The end of the signal sample period occurs when the conversion bit (CONVERT START, ADCTL.7) is set to 1. After a hold time, the converter will reset the SAMPLE START and CONVERT START bits, signaling that a conversion has started and that the analog signal can be removed.

analog timing requirements (see Figure 18)

		MIN	MAX	UNIT
$t_{su}(S)$	Setup time, analog to sample command	0		ns
$t_h(AN)$	Hold time, analog input from start of conversion	$18t_C$		ns
$t_w(S)$	Pulse duration, sample time per kilo- Ω of source impedance [†]	1		$\mu s/k\Omega$

[†] The value given is valid for a signal with a source impedance > 1 k Ω . If the source impedance is < 1 k Ω , use a minimum sampling time of 1 μs .

Figure 18. Analog Timing

Table 18 is designed to aid the user in referencing a device part number to a mechanical drawing. The table shows a cross-reference of the device part number to the TMS370 generic package name and the associated mechanical drawing by drawing number and name.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
