74HC/HCT7403

**4-Bit x 64-word FIFO register;
3-state**

Product specification
Supersedes data of October 1990
File under Integrated Circuits, IC06

September 1993

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

FEATURES

- Synchronous or asynchronous operation
- 3-state outputs
- 30 MHz (typical) shift-in and shift-out rates
- Readily expandable in word and bit dimensions
- Pinning arranged for easy board layout: input pins directly opposite output pins
- Output capability: driver (8 mA)
- I_{CC} category: LSI.

APPLICATIONS

- High-speed disc or tape controller
- Communications buffer.

GENERAL DESCRIPTION

The 74HC/HCT7403 are high-speed Si-gate CMOS devices. They are specified in compliance with JEDEC standard no.7A.

The "7403" is an expandable, First-In First-Out (FIFO) memory organized as 64 words by 4 bits. A guaranteed 15 MHz data-rate makes it ideal for high-speed applications. A higher data-rate can be obtained in applications where the status flags are not used (burst-mode).

With separate controls for shift-in (SI) and shift-out (\overline{SO}), reading and writing operations are completely independent, allowing synchronous and asynchronous data transfers. Additional controls include a master-reset input (\overline{MR}), an output enable input (\overline{OE}) and flags. The data-in-ready (DIR) and data-out-ready (DOR) flags indicate the status of the device.

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns.

SYMBOL	PARAMETER	CONDITIONS	TYP.		UNIT
			HC	HCT	
t _{PHL} /t _{PLH}	propagation delay \overline{SO} , SI to DIR and DOR	C _L = 15 pF; V _{CC} = 5 V	15	17	ns
f _{max}	maximum clock frequency		30	30	MHz
C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per package	note 1	475	490	pF

Note

1. For HC the condition is V_I = GND to V_{CC}.
For HCT the condition is V_I = GND to V_{CC} - 1.5 V.

PINNING

SYMBOL	PIN	DESCRIPTION
\overline{OE}	1	output enable input (active LOW)
DIR	2	data-in-ready output
SI	3	shift-in input (active HIGH)
D ₀ to D ₃	4, 5, 6, 7	parallel data input
GND	8	ground
\overline{MR}	9	asynchronous master-reset input (active LOW)
Q ₃ to Q ₀	10, 11, 12, 13	data output
DOR	14	data-out-ready output
\overline{SO}	15	shift-out input (active LOW)
V _{CC}	16	positive supply voltage

Fig.3 IEC logic symbol.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

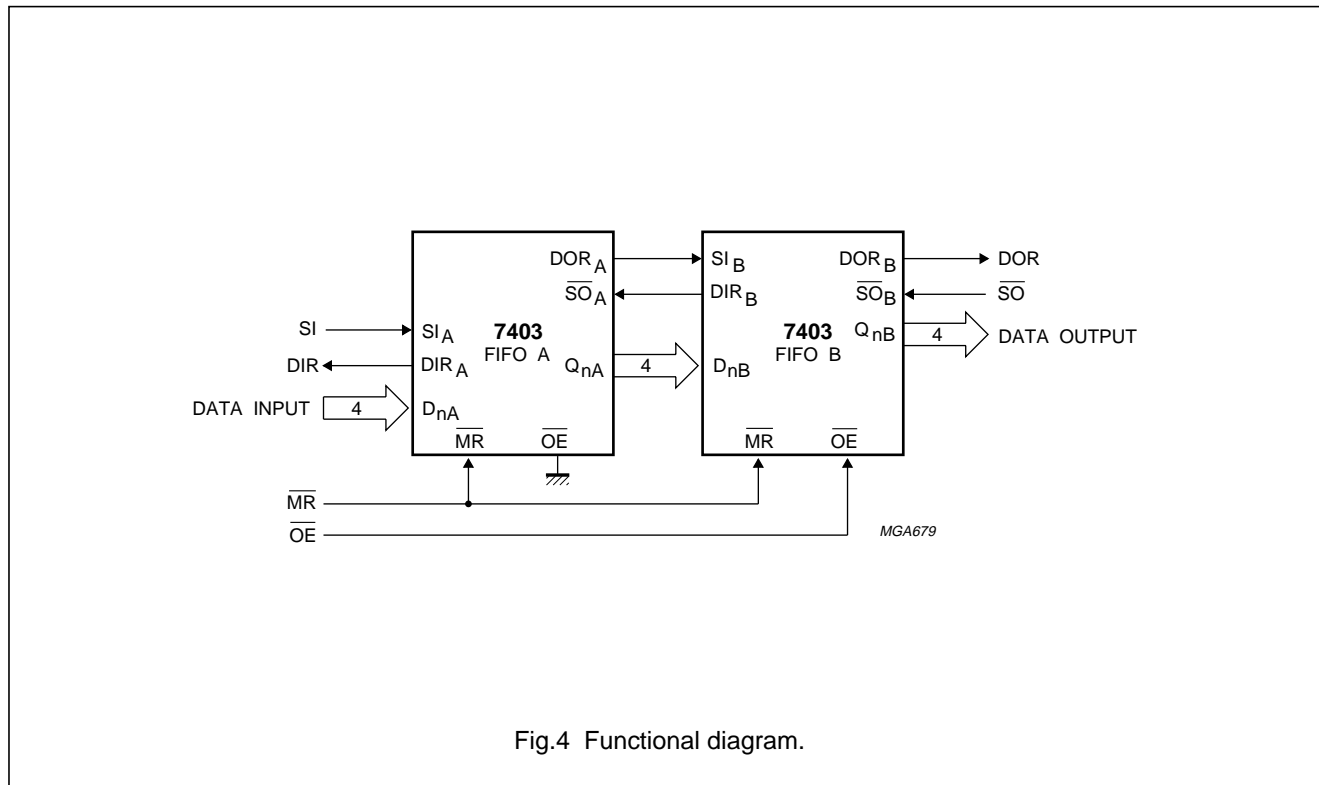

Fig.4 Functional diagram.

FUNCTIONAL DESCRIPTION

A DIR flag indicates the input stage status, either empty and ready to receive data (DIR = HIGH) or full and busy (DIR = LOW). When DIR and SI are HIGH, data present at D₀ to D₃ is shifted into the input stage; once complete DIR goes LOW. When SI is set LOW, data is automatically shifted to the output stage or to the last empty location. A FIFO which can receive data is indicated by DIR set HIGH.

A DOR flag indicates the output stage status, either data available (DOR = HIGH) or busy (DOR = LOW). When \overline{SO} and DOR are HIGH, data is available at the outputs (Q₀ to Q₃). When \overline{SO} is set LOW new data may be shifted into the output stage, once complete DOR is set HIGH.

Expanded format (see Fig.17)

The DOR and DIR signals are used to allow the “7403” to be cascaded. Both parallel and serial expansion is possible.

Serial expansion is only possible with typical devices.

Parallel expansion

Parallel expansion is accomplished by logically ANDing the DOR and DIR signals to form a composite signal.

Serial expansion

Serial expansion is accomplished by:

- tying the data outputs of the first device to the data inputs of the second device
- connecting the DOR pin of the first device to the SI pin of the second device
- connecting the \overline{SO} pin of the first device to the DIR pin of the second device.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

DC CHARACTERISTICS FOR 74HC

For the DC characteristics see *"74HC/HCT/HCU/HCMOS Logic Family Specifications"*, except that V_{OH} and V_{OL} are not valid for driver output.

They are replaced by the values given below.

Output capability: driver 8 mA

I_{CC} category: LSI.

Voltages are referenced to GND (ground = 0 V).

DC CHARACTERISTICS FOR 74HC

SYMBOL	PARAMETER	T_{amb} (°C)							UNIT	TEST CONDITION		
		+25			-40 to +85		-40 to +125			V_{CC} (V)	V_I	OTHER
		MIN	TYP	MAX	MIN	MAX	MIN	MAX

DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see “74HC/HCT/HCU/HCMOS Logic Family Specifications”, except that V_{OH} and V_{OL} are not valid for driver output.

They are replaced by the values given below.

Output capability: driver 8 mA.

I_{CC} category: LSI.

Voltages are referenced to GND (ground = 0 V).

DC CHARACTERISTICS FOR 74HCT

SYMBOL	PARAMETER	T_{amb} (°C)							UNIT	TEST CONDITION		
		+25			-40 to +85		-40 to +125			V_{CC} (V)	V_I	OTHER
		MIN	TYP	MAX	MIN	MAX	MIN	MAX				
V_{OH}	HIGH level output voltage all outputs	4.4	4.5	–	4.4	–	4.4	–	V	4.5	V_{IH} or V_{IL}	$I_O = -20 \mu A$
V_{OH}	HIGH level output voltage driver outputs	3.98	4.32	–	3.84	–	3.7	–	V	4.5	V_{IH} or V_{IL}	$I_O = -8 mA$
V_{OL}	LOW level output voltage all outputs	–	0	0.1	–	0.1	–	0.1	V	4.5	V_{IH} or V_{IL}	$I_O = 20 \mu A$
V_{OL}	LOW level output voltage driver outputs	–	0.15	0.26	–	0.33	–	0.4	V	4.5	V_{IH} or V_{IL}	$I_O = 8 mA$

Notes to the HCT DC Characteristics

1. The value of additional quiescent supply current (ΔI_{CC}) for a unit load of 1 is given in the family specifications.
2. To determine ΔI_{CC} per input, multiply this value by the unit load coefficient shown in the table below.

UNIT LOAD COEFFICIENT

INPUT	UNIT LOAD COEFFICIENT
\overline{OE}	1
SI	1.5
D_n	0.75
\overline{MR}	1.5
\overline{SO}	1.5

4-Bit x 64-word FIFO register; 3-state

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

AC WAVEFORMS

Shifting in sequence FIFO empty to FIFO full

Notes to Fig.6

1. DIR initially HIGH; FIFO is prepared for valid data
2. SI set HIGH; data loaded into input stage
3. DIR goes LOW, input stage "busy"
4. SI set LOW; data from first location "ripple through"
5. DIR goes HIGH, status flag indicates FIFO prepared for additional data
6. Repeat process to load 2nd word through to 64th word into FIFO
 DIR remains LOW; with attempt to shift into full FIFO, no data transfer occurs.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

With FIFO full; SI held HIGH in anticipation of empty location

Notes to Fig.7

1. FIFO is initially full, shift-in is held HIGH
2. \overline{SO} pulse; data in the output stage is unloaded, "bubble-up" process of empty location begins
3. DIR HIGH; when empty location reaches input stage, flag indicates FIFO is prepared for data input
4. DIR returns to LOW; data shift-in to empty location is complete, FIFO is full again
5. SI set LOW; necessary to complete shift-in process, DIR remains LOW, because FIFO is full.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

Master reset applied with FIFO full

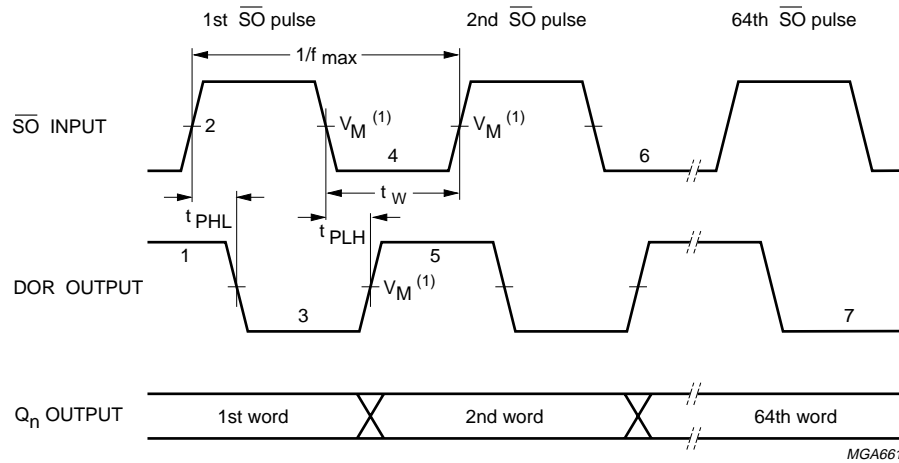

Notes to Fig.8

1. DIR LOW, output ready HIGH; assume FIFO is full
2. $\overline{\text{MR}}$ pulse LOW; clears FIFO
3. DIR goes HIGH; flag indicates input prepared for valid data
4. DOR goes LOW; flag indicates FIFO empty
5. Q_n outputs go LOW (only last bit will be reset).

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

(1) HC : $V_M = 50\%$; $V_I = \text{GND to } V_{CC}$.
 HCT: $V_M = 1.3 \text{ V}$; $V_I = \text{GND to } 3 \text{ V}$.

Fig.9 Waveforms showing the $\overline{S_O}$ input to DOR output propagation delay. The $\overline{S_O}$ pulse widths and maximum pulse frequency.

Notes to Fig.9

1. DOR HIGH; no data transfer in progress, valid data is present at output stage
2. $\overline{S_O}$ set HIGH; results in DOR going LOW
3. DOR goes LOW; output stage "busy"
4. $\overline{S_O}$ set LOW; data in the input stage is unloaded, and new data replaces it as empty location "bubbles-up" to input stage
5. DOR goes HIGH; transfer process completed, valid data present at output after the specified propagation delay
6. Repeat process to unload the 3rd through to the 64th word from FIFO
7. DOR remains LOW; FIFO is empty.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

With FIFO empty; \overline{SO} is held HIGH in anticipation

Notes to Fig.10

1. FIFO is initially empty, \overline{SO} is held HIGH
2. SI pulse; loads data into FIFO and initiates ripple through process
3. DOR flag signals the arrival of valid data at the output stage
4. Output transition; data arrives at output stage after the specified propagation delay between the rising edge of the DOR pulse to the Q_n output
5. DOR goes LOW; data shift-out is complete, FIFO is empty again
6. \overline{SO} set LOW; necessary to complete shift-out process. DOR remains LOW, because FIFO is empty.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

Shift-in operation; high-speed burst mode

(1) HC : $V_M = 50\%$; $V_I = \text{GND to } V_{CC}$.
 HCT: $V_M = 1.3 \text{ V}$; $V_I = \text{GND to } 3 \text{ V}$.

Fig.11 Waveforms showing SI minimum pulse width and maximum pulse frequency, in high-speed shift-in burst mode.

Note to Fig.11

In the high-speed mode, the burst-in rate is determined by the minimum shift-in HIGH and shift-in LOW specifications. The DIR status flag is a don't care condition, and a shift-in pulse can be applied regardless of the flag. A SI pulse which would overflow the storage capacity of the FIFO is ignored.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

Shift-out operation; high-speed burst mode

(1) HC : $V_M = 50\%$; $V_I = \text{GND to } V_{CC}$.
 HCT: $V_M = 1.3 \text{ V}$; $V_I = \text{GND to } 3 \text{ V}$.

Fig.12 Waveforms showing $\overline{S_O}$ minimum pulse width and maximum pulse frequency, in high-speed shift-out burst mode.

Note to Fig.12

In the high-speed mode, the burst-out rate is determined by the minimum shift-out HIGH and shift-out LOW specifications. The DOR flag is a don't care condition and an $\overline{S_O}$ pulse can be applied without regard to the flag.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

(1) HC : $V_M = 50\%$; $V_I = \text{GND to } V_{CC}$.
 HCT: $V_M = 1.3 \text{ V}$; $V_I = \text{GND to } 3 \text{ V}$.

The shaded areas indicate when the input is permitted to change for predictable output performance.

Fig.13 Waveforms showing hold and set-up times for D_n input to SI input.

(1) HC : $V_M = 50\%$; $V_I = \text{GND to } V_{CC}$.
 HCT: $V_M = 1.3 \text{ V}$; $V_I = \text{GND to } 3 \text{ V}$.

APPLICATION INFORMATION

Fig.17 Expanded FIFO (parallel and serial) for increased word length; 8 bits wide x 64 n-bits.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

Note to Fig.18

The "7403" is easily expanded to increase word length. Composite DIR and DOR flags are formed with the addition of an AND gate. The basic operation and timing are identical to a single FIFO, with the exception of an added gate delay on the flags.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

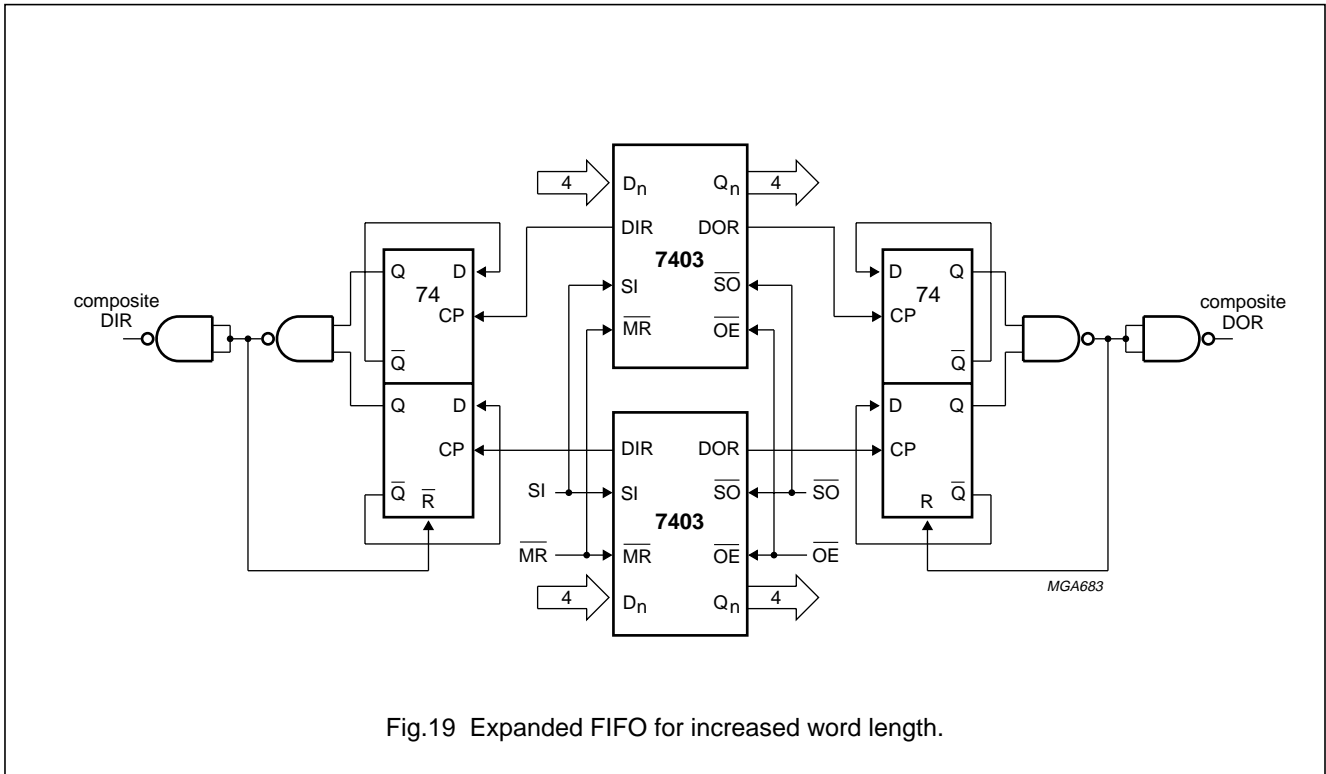

Fig.19 Expanded FIFO for increased word length.

Note to Fig.19

This circuit is only required if the SI input is constantly held HIGH, when the FIFO is empty and the automatic shift-in cycles are started or if SO output is constantly held HIGH, when the FIFO is full and the automatic shift-out cycles are started (see Figs 7 and 10).

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

Expanded format

Figure 20 shows two cascaded FIFOs providing a capacity of 128 words x 4 bits. Figure 21 shows the signals on the nodes of both FIFOs after the application of a SI pulse, when both FIFOs are initially empty. After a ripple through delay, data arrives at the output of FIFO_A. Due to \overline{SO}_A being HIGH, a DOR_A pulse is generated. The requirements of SI_B

and D_{nB} are satisfied by the DOR_A pulse width and the timing between the rising edge of DOR_A and Q_{nA}. After a second ripple through delay, data arrives at the output of FIFO_B.

Figure 22 shows the signals on the nodes of both FIFOs after the application of a \overline{SO}_B pulse, when both FIFOs are initially full. After a bubble-up delay a DIR_B pulse is generated, which acts as a \overline{SO}_A pulse

for FIFO_A. One word is transferred from the output of FIFO_A to the input of FIFO_B. The requirements of the \overline{SO}_A pulse for FIFO_A is satisfied by the pulse width of DOR_B. After a second bubble-up delay an empty space arrives at D_{nA}, at which time DIR_A goes HIGH. Figure 23 shows the waveforms at all external nodes of both FIFOs during a complete shift-in and shift-out sequence.

Fig.20 Cascading for increased word capacity; 128 words x 4 bits.

Note to Fig.20

The “7403” is easily cascaded to increase word capacity without any external circuitry. In cascaded format, all necessary communications are handled by the FIFOs. Figures 21 and 22 demonstrate the intercommunication timing between FIFO_A and FIFO_B. Figure 23 provides an overview of pulses and timing of two cascaded FIFOs, when shifted full and shifted empty again.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

Fig.21 FIFO to FIFO communication; input timing under empty condition.

Notes to Fig.21

1. FIFO_A and FIFO_B initially empty, \overline{SO}_A held HIGH in anticipation of data
2. Load one word into FIFO_A; SI pulse applied, results in DIR pulse
3. Data-out_A/data-in_B transition; valid data arrives at FIFO_A output stage after a specified delay of the DOR flag, meeting data input set-up requirements of FIFO_B
4. DOR_A and SI_B pulse HIGH; (ripple through delay after SI_A LOW) data is unloaded from FIFO_A as a result of the data output ready pulse, data is shifted into FIFO_B
5. DIR_B and \overline{SO}_A go LOW; flag indicates input stage of FIFO_B is busy, shift-out of FIFO_A is complete
6. DIR_B and \overline{SO}_A go HIGH automatically; the input stage of FIFO_B is again able to receive data, \overline{SO} is held HIGH in anticipation of additional data
7. DOR_B goes HIGH; (ripple through delay after SI_B LOW) valid data is present one propagation delay later at the FIFO_B output stage.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

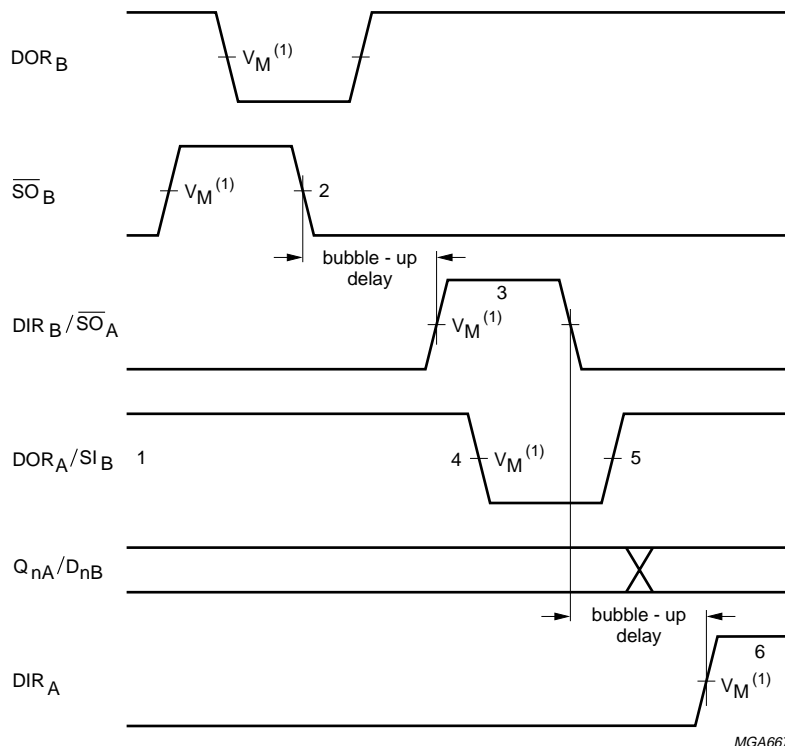

Fig.22 FIFO to FIFO communication; output timing under full condition.

Notes to Fig.22

1. FIFO_A and FIFO_B initially full, SI_B held HIGH in anticipation of shifting in new data as an empty location bubbles-up
2. Unload one word from FIFO_B; $\overline{S_O}$ pulse applied, results in DOR pulse
3. DIR_B and $\overline{S_O_A}$ pulse HIGH; (bubble-up delay after $\overline{S_O_B}$ LOW) data is loaded into FIFO_B as a result of the DIR pulse, data is shifted out of FIFO_A
4. DOR_A and SI_B go LOW; flag indicates the output stage of FIFO_A is busy, shift-in to FIFO_B is complete
5. DOR_A and SI_B go HIGH; flag indicates valid data is again available at FIFO_A output stage, SI_B is held HIGH, awaiting bubble-up of empty location
6. DIR_A goes HIGH; (bubble-up delay after $\overline{S_O_A}$ LOW) an empty location is present at input stage of FIFO_A.

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

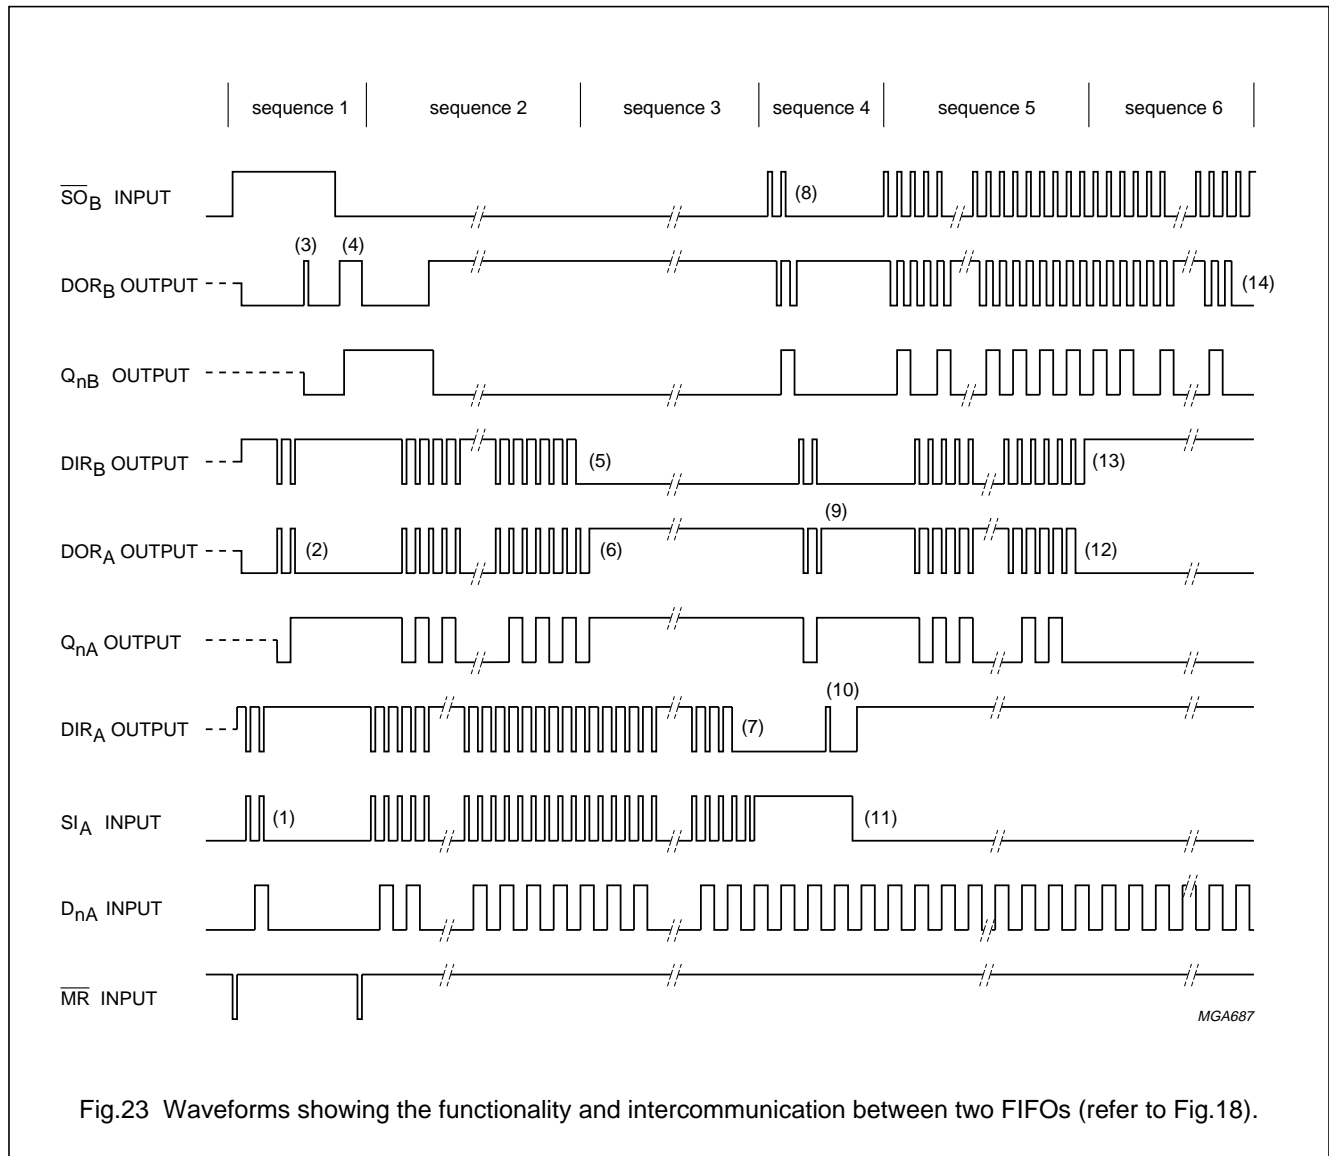

Fig.23 Waveforms showing the functionality and intercommunication between two FIFOs (refer to Fig.18).

Note to Fig.23

Sequence 1 (both FIFOs empty, starting SHIFT-IN process)

After a \overline{M}_R pulse has been applied $FIFO_A$ and $FIFO_B$ are empty. The DOR flags of $FIFO_A$ and $FIFO_B$ go LOW due to no valid data being present at the outputs. The DIR flags are set HIGH due to the FIFOs being ready to accept data. \overline{S}_O_B is held HIGH and two S_I_A pulses are applied (1). These pulses allow two data words to ripple through to the output stage of $FIFO_A$ and to the input stage of $FIFO_B$ (2). When data arrives at the output of $FIFO_B$, a DOR_B pulse is generated (3). When \overline{S}_O_B goes LOW, the first bit is shifted out and a second bit ripples through to the output after which DOR_B goes HIGH (4).

4-Bit x 64-word FIFO register; 3-state

74HC/HCT7403

Sequence 2 (FIFO_B runs full)

After the \overline{MR} pulse, a series of 64 SI pulses are applied. When 64 words are shifted in, DIR_B remains LOW due to FIFO_B being full (5). DOR_A goes LOW due to FIFO_A being empty.

Sequence 3 (FIFO_A runs full)

When 65 words are shifted in, DOR_A remains HIGH due to valid data remaining at the output of FIFO_A. Q_{nA} remains HIGH, being the polarity of the 65th data word (6). After the 128th SI pulse, DIR remains LOW and both FIFOs are full (7). Additional pulses have no effect.

Sequence 4 (both FIFOs full, starting SHIFT-OUT process)

SI_A is held HIGH and two \overline{SO}_B pulses are applied (8). These pulses shift out two words and thus allow two empty locations to bubble-up to the input stage of FIFO_B, and proceed to FIFO_A (9). When the first empty location arrives at the input of FIFO_A, a DIR_A pulse is generated (10) and a new word is shifted into FIFO_A. SI_A is made LOW and now the second empty location reaches the input stage of FIFO_A, after which DIR_A remains HIGH (11).

Sequence 5 (FIFO_A runs empty)

At the start of sequence 5 FIFO_A contains 63 valid words due to two words being shifted out and one word being shifted in, in sequence 4. An additional series of \overline{SO}_B pulses are applied. After 63 \overline{SO}_B pulses, all words from FIFO_A are shifted into FIFO_B. DOR_A remains LOW (12).

Sequence 6 (FIFO_B runs empty)

After the next \overline{SO}_B pulse, DIR_B remains HIGH due to the input stage of FIFO_B being empty. After another 63 \overline{SO}_B pulses, DOR_B remains LOW due to both FIFOs being empty (14). Additional \overline{SO}_B pulses have no effect. The last word remains available at the output Q_n.
