DESCRIPTION

An RF amplifier module designed for use in transmitters of mobile communications equipment powered by a 12.5 V battery supply.

The module is a two stage transistor amplifier and consists of two RF npn transistors mounted on a ceramic substrate, together with surface mounted components that make up the matching and bias circuits.

The module will provide 27 W RF power into a 50 Ω load, when operated at nominal conditions within the frequency range of 174 to 200 MHz.

STABILITY

The module is stable when operated with a load of up to 3:1 at all phases, providing the operating conditions are as follows:

P_D 15 to 450 mW; $P_L \geq 3$ to ≤ 40 W;
 $V_{S1} = 1.5$ to 15.5 V;
 $V_{S2} = 10.5$ to 15.5 V and $V_{S1} < V_{S2}$.

RUGGEDNESS

The output power of the module into a 50 Ω load will be unchanged after one minute of operation into a load mismatch of 20:1 (any phase), providing maximum ratings are not exceeded.

$V_{S1}, V_{S2} \leq 15.5$ V; $T_h \leq 90$ °C;
 $P_L \leq 40$ W; $P_D < 450$ mW.

RF POWER CONTROL

The module is designed to be operated over a power range up to 27 W, under nominal conditions. The output power may be controlled by adjusting the input power, P_D , or the first stage supply voltage, V_{S1} .

$P_D = 15$ to 450 mW;
 $V_{S1} = 1.5$ V to V_{S2} .
