GENERAL DESCRIPTION

The 74HC/HCT356 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT356 data selectors/multiplexers contain full on-chip binary decoding, to select one-of-eight data sources. The data select address is stored in transparent latches that are enabled by a LOW on the latch enable input \overline{LE} .

Data on the 8 input lines (D_0 to D_7) is clocked into an edge-triggered data register by a LOW-to-HIGH transition of the clock (CP).

When the output enable input $\overline{OE}_1 = \text{HIGH}$, $\overline{OE}_2 = \text{HIGH}$ or $\overline{OE}_3 = \text{LOW}$, the outputs go to the high impedance OFF-state.

Operation of these output enable inputs does not affect the state of the latches and register.

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t_{PHL} / t_{PLH}	propagation delay S_n , \overline{LE} to Y , \overline{Y} CP to Y , \overline{Y}	$C_L = 15 \text{ pF}$ $V_{CC} = 5 \text{ V}$	24 20	25 22	ns ns
C_I	input capacitance		3.5	3.5	pF
C_{PD}	power dissipation capacitance per package	notes 1 and 2	123	125	pF

GND = 0 V; $T_{\text{amb}} = 25^\circ\text{C}$; $t_r = t_f = 6 \text{ ns}$

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{\text{PD}} \times V_{CC}^2 \times f_i + \Sigma (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz
 f_o = output frequency in MHz
 $\Sigma (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

C_L = output load capacitance in pF
 V_{CC} = supply voltage in V

2. For HC the condition is $V_I = \text{GND to } V_{CC}$
 For HCT the condition is $V_I = \text{GND to } V_{CC} - 1.5 \text{ V}$
