ABB0205
Low Skew Output Buffer

FEATURES

- Frequency range 25 ~ 60MHz.
- Internal phase locked loop will allow spread spectrum modulation on reference clock to pass to the outputs (up to 100kHz SST modulation).
- Zero input - output delay.
- Less than 700 ps device - device skew.
- Less than 250 ps skew between outputs.
- Less than 150 ps cycle - cycle jitter.
- Output Enable function tri-state outputs.
- 3.3V operation.
- Available in 8-Pin 150mil SOIC.

DESCRIPTION

The ABB0205 is a high performance, low skew, low jitter zero delay buffer designed to distribute high speed clocks and is available in 8-pin SOIC package. It has four outputs that are synchronized with the input. The synchronization is established via CLKOUT feed back to the input of the PLL. Since the skew between the input and output is less than ±350 ps, the device acts as a zero delay buffer.

PIN CONFIGURATION

| REF | 1 | | 8 | CLKOUT |
CLK2	2	ABB0205	7	CLK4
CLK1	3		6	VDD
GND	4		5	CLK3

Remark

If REF clock is stopped for more than 10us after it has already been provided to the chip, and after power-up, the output clocks will disappear. In that instance, a full power-up reset is required in order to reactivate the output clocks.

PIN DESCRIPTIONS

Name	Number	Type	Description
REF[1]	1	I	Input reference frequency. Spread spectrum modulation on this signal will be passed to the output (up to 100kHz SST modulation).
CLK2[2]	2	O	Buffered clock output.
CLK1[2]	3	O	Buffered clock output.
GND	4	P	Ground.
CLK3[2]	5	O	Buffered clock output.
VDD	6	P	3.3V Power Supply.
CLK4[2]	7	O	Buffered clock output.
CLKOUT[2]	8	O	Buffered clock output. Internal feed back on this pin.

Notes: 1: Weak pull-down. 2: Weak pull-down on all outputs.

Exposure of the device under conditions beyond the limits specified by Maximum Ratings for extended periods may cause permanent damage to the device and affect product reliability. These conditions represent a stress rating only, and functional operations of the device at these or any other conditions above the operational limits noted in this specification is not implied.

* **Note**: Operating Temperature is guaranteed by design for all parts (COMMERCIAL and INDUSTRIAL), but tested for COMMERCIAL grade only.

Output-Output Skew

The skew between CLKOUT and the CLK(1-4) outputs is not dynamically adjusted by the PLL. Since CLKOUT is one of the inputs to the PLL, zero phase difference is maintained from REF to CLKOUT. If all outputs are equally loaded, zero phase difference will maintained from REF to all outputs.

If applications requiring zero output-output skew, all the outputs must equally loaded.

If the CLK(1-4) outputs are less loaded than CLKOUT, CLK(1-4) outputs will lead it; if the CLK(0-4) is more loaded than CLKOUT, CLK(1-4) will lag the CLKOUT.

Since the CLKOUT and the CLK(1-4) outputs are identical, they all start at the same time, but difference loads cause them to have different rise times and different times crossing the measurement thresholds.
