

2.5V CMOS Dual 1-To-5 Clock Driver

Features

- Advanced CMOS Technology
- Guaranteed low skew < 200pS (max.)
- Very low propagation delay < 2.5nS (max)
- Very low duty cycle distortion < 270pS (max)
- Very low CMOS power levels
- Operating frequency up to 166MHz
- TTL compatible inputs and outputs
- Two independent output banks with 3-state control
- 1:5 fanout per bank
- "Heartbeat" monitor output
- $V_{CC} = 2.5V \pm 0.2V$
- Available in SSOP and QSOP packages

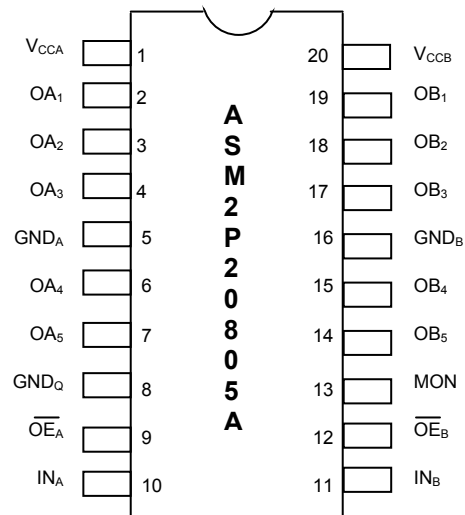

Functional Description

The ASM2P20805A is a 2.5V Clock driver built using advanced CMOS technology. The device consists of two banks of drivers, each with a 1:5 fanout and its own output enable control. The device has a "heartbeat" monitor for diagnostics and PLL driving. The MON output is identical to all other outputs and complies with the output specifications in this document. The ASM2P20805A offers low capacitance inputs. The ASM2P20805A is designed for high speed clock distribution where signal quality and skew are critical. The ASM2P20805A also allows single point-to-point transmission line driving in applications such as address distribution, where one signal must be distributed to multiple receivers with low skew and high signal quality.

			$I_{OL} = 100\mu\text{A}$	-	-	0.2	

Notes:

- For conditions shown as Max. or Min., use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at $V_{CC} = 2.5\text{V}$, 25°C ambient.
- Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
- This parameter is guaranteed but not tested.
- $V_{OH} = V_{CC} - 0.6\text{V}$ at rated current.

Notes:

- See test circuits and waveforms.
- Minimum limits are guaranteed but not tested on Propagation Delays.
- t_{PLH} and t_{PHL} are production tested. All other parameters guaranteed but not production tested.
- Propagation delay range indicated by Min. and Max. limit is due to V_{CC} , operating temperature and process parameters. These propagation delay limits do not imply skew.
- Skew measured between all outputs under identical transitions and load conditions.
- Skew measured is difference between propagation delay times t_{PHL} and t_{PLH} of same outputs under identical load conditions.
- Part to part skew for all outputs given identical transitions and load conditions at identical V_{CC} levels and temperature.
- Airflow of 1m/s is recommended for frequencies above 133MHz.
- This parameter is measured using $f = 1MHz$.
