1 Overview

1.1 Features

- Non-parity 200-Pin Small Outline Dual-In-Line Memory Modules
- Two ranks 64M ×64 organization
- JEDEC standard Double Data Rate Synchronous DRAMs (DDR SDRAM)
- Single +2.5 V (± 0.2 V) power supply and Single +2.6V (± 0.1 V) power supply for DDR400
- Built with 256 Mbit DDR SDRAMs organised as ×8 in P-TFBGA-60 packages
- Programmable CAS Latency, Burst Length, and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- All inputs and outputs SSTL_2 compatible
- Serial Presence Detect with E²PROM
- Jedec standard form factor: 67.60 mm × 31.75 mm × 3.80 mm
- Gold plated contacts

1.2 Description

The HYS64D64020HBDL-5-C and HYS64D64020GBDL-5-C are industry standard 200-Pin Small Outline Dual-In-Line Memory Modules (SO-DIMMs) organized as 64M ×64. The memory array is designed with Double Data Rate Synchronous DRAMs (DDR SDRAM). A variety of decoupling capacitors are mounted on the PC board. The DIMMs feature serial presence detect based on a serial E²PROM device using the 2-pin I²C protocol. The first 128 bytes are programmed with configuration data and the second 128 bytes are available to the customer.

Notes

1. All part numbers end with a place code designating the silicon-die revision. Reference information available on request. Example: HYS64D32020GDL-6-B, indicating rev. B dies are used for SDRAM components.
2. The Compliance Code is printed on the module labels describing the speed sort (for example "PC2700"), the latencies and SPD code definition (for example "2033-0" means CAS latency of 2.0 clocks, RCD¹⁾ latency of 3 clocks, Row Precharge latency of 3 clocks, and JEDEC SPD code definition version 0), and the Row Card used for this module.

1) RCD: Row-Column-Delay

2 Pin Configuration

The pin configuration of the Unbuffered Small Outline DDR SDRAM DIMM is listed by function in **Table 3** (184 pins). The abbreviations used in columns Pin and Buffer Type are explained in **Table 4** and **Table 5** respectively. The pin numbering is depicted in **Figure 1**.

Attention: Permanent damage to the device may occur if “Absolute Maximum Ratings” are exceeded. This is a stress rating only, and functional operation should be restricted to recommended operation conditions. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability and exceeding only one of the values may cause irreversible damage to the integrated circuit.

1) $0\text{ }^\circ\text{C} \leq T_A \leq 70\text{ }^\circ\text{C}$

2) DDR400 conditions apply for all clock frequencies above 166 MHz

3) Peak to peak AC noise on V_{REF} may not exceed $\pm 2\% V_{REF(DC)}$. V_{REF} is also expected to track noise variations in V_{DDQ} .

4) V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} , and must track variations in the DC level of V_{REF} .

5) V_{ID} is the magnitude of the difference between the input level on CK and the input level on \overline{CK} .

6) The ratio of the pull-up current to the pull-down current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltage from 0.25 to 1.0 V. For a given output, it represents the maximum difference between pull-up and pull-down drivers due to process variation.

7) Inputs are not recognized as valid until V_{REF} stabilizes.

8) Values are shown per DDR SDRAM component

- 1) Module I_{DD} values are calculated on the basis of component I_{DD} and can be measured differently according to DQ loading capacity.
- 2) Test condition for maximum values: $V_{DD} = 2.7 \text{ V}$, $T_A = 10 \text{ °C}$
- 3) The module I_{DDx} values are calculated from the I_{DDx} values of the component data sheet as follows:
 $m \times I_{DDx}[\text{component}] + n \times I_{DD3N}[\text{component}]$ with **m** and **n** number of components of rank 1 and 2; **n=0** for 1 rank modules
- 4) DQ I/O (I_{DDQ}) currents are not included in the calculations (see note 1)
- 5) The module I_{DDx} values are calculated from the component I_{DDx} data sheet values as: $(m + n) \times I_{DDx}[\text{component}]$

- 1) $0\text{ }^{\circ}\text{C} \leq T_A \leq 70\text{ }^{\circ}\text{C}$; $V_{DDQ} = 2.5\text{ V} \pm 0.2\text{ V}$, $V_{DD} = +2.5\text{ V} \pm 0.2\text{ V}$ (DDR333); $V_{DDQ} = 2.6\text{ V} \pm 0.1\text{ V}$, $V_{DD} = +2.6\text{ V} \pm 0.1\text{ V}$ (DDR400)
- 2) Input slew rate $\geq 1\text{ V/ns}$ for DDR400, DDR333
- 3) The CK/\overline{CK} input reference level (for timing reference to CK/\overline{CK}) is the point at which CK and \overline{CK} cross: the input reference level for signals other than CK/\overline{CK} , is V_{REF} . CK/\overline{CK} slew rate are $\geq 1.0\text{ V/ns}$.
- 4) Inputs are not recognized as valid until V_{REF} stabilizes.
- 5) The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (note 3) is V_{TT} .
- 6) These parameters guarantee device timing, but they are not necessarily tested on each device.
- 7) t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
- 8) The specific requirement is that DQS be valid (HIGH, LOW, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on t_{DQSS} .
- 9) The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- 10) Fast slew rate $\geq 1.0\text{ V/ns}$, slow slew rate $\geq 0.5\text{ V/ns}$ and $< 1\text{ V/ns}$ for command/address and CK & \overline{CK} slew rate $> 1.0\text{ V/ns}$, measured between $V_{IH(ac)}$ and $V_{IL(ac)}$.
- 11) For each of the terms, if not already an integer, round to the next highest integer. t_{CK} is equal to the actual system clock cycle time.
- 12) A maximum of eight Autorefresh commands can be posted to any given DDR SDRAM device.
