# Low-Cost 3.3V Spread Aware™ Zero Delay Buffer

**CY23S09**  
**CY23S05**

## Features

- 10-MHz to 100-/133-MHz operating range, compatible with CPU and PCI bus frequencies
- Zero input-output propagation delay
- Multiple low-skew outputs
  - Output-output skew less than 250 ps
  - Device-device skew less than 700 ps
  - One input drives five outputs (CY23S05)
  - One input drives nine outputs, grouped as 4 + 4 + 1 (CY23S09)
- Less than 200 ps cycle-to-cycle jitter is compatible with Pentium®-based systems
- Test Mode to bypass PLL (CY23S09 only, see Select Input Decoding table on page 2)
- Available in space-saving 16-pin, 150-mil SOIC, 4.4 mm TSSOP, and 150-mil SSOP (CY23S09) or 8-pin, 150-mil SOIC package (CY23S05)
- 3.3V operation, advanced 0.65µ CMOS technology
- Spread Aware™

## Functional Description

The CY23S09 is a low-cost 3.3V zero delay buffer designed to distribute high-speed clocks and is available in a 16-pin SOIC package. The CY23S05 is an eight-pin version of the CY23S09. It accepts one reference input, and drives out five low-skew clocks. The -1H versions of each device operate at

up to 100-/133-MHz frequencies, and have higher drive than the -1 devices. All parts have on-chip PLLs that lock to an input clock on the REF pin. The PLL feedback is on-chip and is obtained from the CLKOUT pad.

The CY23S09 has two banks of four outputs each, which can be controlled by the Select inputs as shown in the Select Input Decoding table on page 2. If all output clocks are not required, Bank B can be three-stated. The select inputs also allow the input clock to be directly applied to the outputs for chip and system testing purposes.

The CY23S09 and CY23S05 PLLs enter a power-down mode when there are no rising edges on the REF input. In this state, the outputs are three-stated and the PLL is turned off, resulting in less than 12.0 µA of current draw (for commercial temperature devices) and 25.0 µA (for industrial temperature devices). The CY23S09 PLL shuts down in one additional case, as shown in the table below.

Multiple CY23S09 and CY23S05 devices can accept the same input clock and distribute it. In this case, the skew between the outputs of two devices is guaranteed to be less than 700 ps.

All outputs have less than 200 ps of cycle-to-cycle jitter. The input to output propagation delay on both devices is guaranteed to be less than 350 ps, and the output to output skew is guaranteed to be less than 250 ps.

The CY23S05/CY23S09 is available in two different configurations, as shown in the ordering information on page 6. The CY23S05-1/CY23S09-1 is the base part. The CY23S05-1H/CY23S09-1H is the high-drive version of the -1, and its rise and fall times are much faster than -1.

### Zero Delay and Skew Control

All outputs should be uniformly loaded to achieve Zero Delay between the input and output. Since the CLKOUT pin is the internal feedback to the PLL, its relative loading can adjust the input-output delay. This is shown in the above graph.

For applications requiring zero input-output delay, all outputs, including CLKOUT, must be equally loaded. Even if CLKOUT is not used, it must have a capacitive load equal to that on other outputs, for obtaining zero input-output delay. If input to output delay adjustments are required, use the above graph to calculate loading differences between the CLKOUT pin and other outputs.

For zero output-output skew, be sure to load all outputs equally. For further information, refer to the application note “CY23S05 and CY23S09 as PCI and SDRAM Buffers.”

### Spread Aware

Many systems being designed now utilize a technology called Spread Spectrum Frequency Timing Generation. Cypress has been one of the pioneers of SSFTG development, and we designed this product so as not to filter off the Spread Spectrum feature of the Reference input, assuming it exists. When a zero delay buffer is not designed to pass the SS feature through, the result is a significant amount of tracking skew which may cause problems in systems requiring synchronization.

For more details on Spread Spectrum timing technology, please see the Cypress application note entitled, “EMI Suppression Techniques with Spread Spectrum Frequency Timing Generator (SSFTG) ICs.”

### Pin Description for CY23S09

Pin	Signal	Description
1	REF <sup>[2]</sup>	Input reference frequency, 5V-tolerant input
2	CLKA1 <sup>[3]</sup>	Buffered clock output, bank A
3	CLKA2 <sup>[3]</sup>	Buffered clock output, bank A
4	V <sub>DD</sub>	3.3V supply
5	GND	Ground
6	CLKB1 <sup>[3]</sup>	Buffered clock output, bank B
7	CLKB2 <sup>[3]</sup>	Buffered clock output, bank B
8	S2 <sup>[4]</sup>	Select input, bit 2
9	S1 <sup>[4]</sup>	Select input, bit 1
10	CLKB3 <sup>[3]</sup>	Buffered clock output, bank B
11	CLKB4 <sup>[3]</sup>	Buffered clock output, bank B
12	GND	Ground
13	V <sub>DD</sub>	3.3V supply

15	CLKA4 <sup>[3]</sup>	Buffered clock output, bank A
16	CLKOUT <sup>[3]</sup>	Buffered output, internal feedback on this pin

**Notes:**

1. This output is driven and has an internal feedback for the PLL. The load on this output can be adjusted to change the skew between the reference and output.
2. Weak pull-down.
3. Weak pull-down on all outputs.
4. Weak pull-up on these inputs.
