

Rail-to-Rail High Output Current Single Operational Amplifier

- Rail-to-rail input and output
- Low noise: 9nV/ $\sqrt{\text{Hz}}$
- Low distortion
- High output current: 80mA (able to drive 32 Ω loads)
- High-speed: 4MHz, 1V/ μs
- Operating from 2.7V to 12V
- ESD internal protection: 1.5kV
- Latch-up immunity
- Macromodel included in this specification

Description

The TS921 is a rail-to-rail single BiCMOS operational amplifier optimized and fully specified for 3V and 5V operation.

Its high output current allows low-load impedances to be driven.

The TS921 exhibits very low noise, low distortion and low offset. It has a high output current capability which makes this device an excellent choice for high quality, low voltage or battery-operated audio systems.

The device is stable for capacitive loads up to 500pF.

Applications

- Headphone amplifier
- Piezoelectric speaker driver
- Sound cards, multimedia systems
- Line driver, actuator driver
- Servo amplifier
- Mobile phone and portable communication sets
- Instrumentation with low noise as key factor

- All voltage values, except differential voltage are with respect to network ground terminal.
- Differential voltages are the non-inverting input terminal with respect to the inverting input terminal. If V_{id} > ±1V, the maximum input current must not exceed ±1mA. In this case (V_{id} > ±1V) an input series resistor must be added to limit input current.
- Human body model, 100pF discharged through a 1.5kΩ resistor into pin of device.
- Machine model ESD, a 200pF cap is charged to the specified voltage, then discharged directly into the IC with no external series resistor (internal resistor < 5Ω), into pin to pin of device.
- There is no short-circuit protection inside the device: short-circuits from the output to V_{CC} can cause excessive heating. The maximum output current is approximately 80mA, independent of the magnitude of V_{CC}. Destructive dissipation can result from simultaneous short-circuits on all amplifiers.

3 Macromodels

3.1 Important note concerning this macromodel

Please consider following remarks before using this macromodel:

- All models are a trade-off between accuracy and complexity (i.e. simulation time).
- Macromodels are not a substitute to breadboarding; rather, they confirm the validity of a design approach and help to select surrounding component values.
- A macromodel emulates the NOMINAL performance of a TYPICAL device within SPECIFIED OPERATING CONDITIONS (i.e. temperature, supply voltage, etc.). Thus the macromodel is often not as exhaustive as the datasheet, its goal is to illustrate the main parameters of the product.
- Data issued from macromodels used outside of its specified conditions (V_{CC} , Temperature, etc) or even worse: outside of the device operating conditions (V_{CC} , V_{icm} , etc) are not reliable in any way.

In [Section 3.3](#), the electrical characteristics resulting from the use of these macromodels are presented.

3.2 Electrical characteristics from macromodelization

4 Package Mechanical Data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

5 Revision History

Date	Revision	Changes
Feb. 2001	1	Initial release - Product in full production.
Dec. 2004	2	Modifications on AMR table page 2 (explanation of Vid and Vi limits, ESD MM and CDM values added, Rthja added)
Nov. 2005	3	The following changes were made in this revision: <ul style="list-style-type: none"> – PPAP references inserted in the datasheet see <i>Table . Order Codes on page 2.</i> – Data in tables <i>Electrical Characteristics on page 4</i> reformatted for easier use. – Thermal Resistance Junction to Case added in <i>Table 1. on page 3.</i>
