## DESCRIPTION

The P4C188 and P4C188L are 65,536-bit ultra high speed static RAMs organized as 16K x 4. The CMOS memories require no clocks or refreshing and have equal access and cycle times. Inputs and outputs are fully TTL-compatible. The RAMs operate from a single 5V±10% tolerance power supply. With battery backup, data integrity is maintained for supply voltages down to 2.0V. Current drain is typically 10 µA from a 2.0V supply.

Access times as fast as 10 nanoseconds are available, permitting greatly enhanced system speeds. CMOS is utilized to reduce power consumption to a low 715mW active, 193mW standby and only 5mW in the P4C188L version.

The P4C188 and P4C188L are available in 22-pin 300 mil DIP, 24-pin 300 mil SOJ and 22-pin LCC packages providing excellent board level densities.

#### TIMING WAVEFORM OF READ CYCLE NO. 2<sup>(6)</sup>

**Notes:**

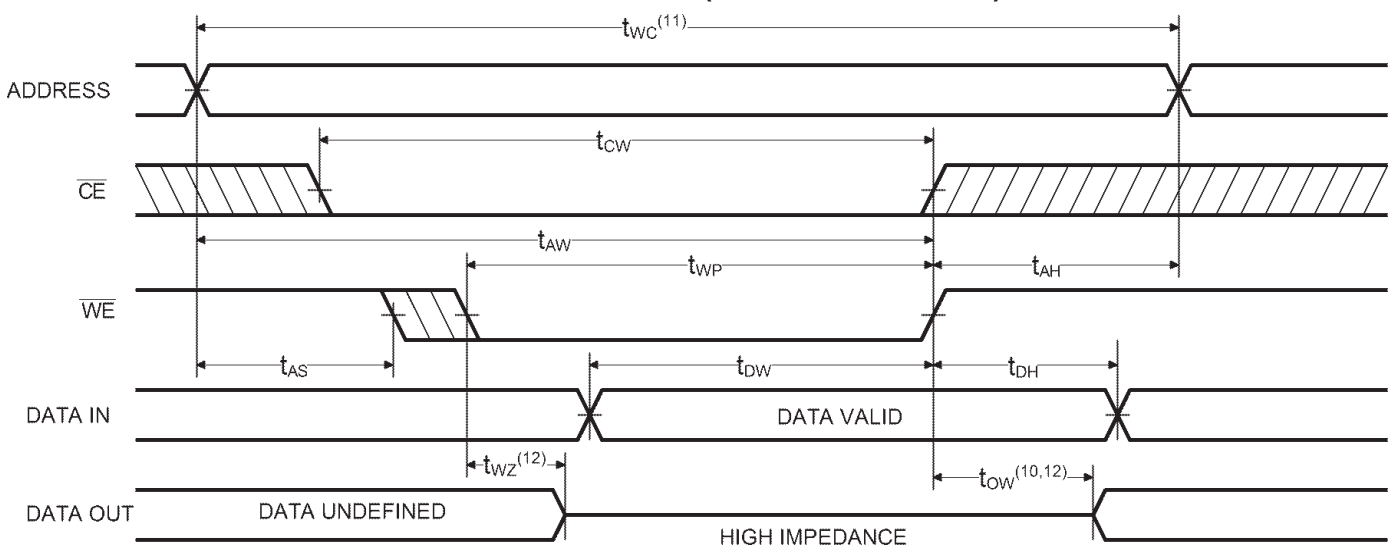

- 5.  $\overline{CE}$  is LOW and  $\overline{WE}$  is HIGH for READ cycle.
- 6.  $\overline{WE}$  is HIGH, and address must be valid prior to or coincident with  $\overline{CE}$  transition LOW.
- 7. Transition is measured  $\pm 200mV$  from steady state voltage prior to change with specified loading in Figure 1. This parameter is sampled and not 100% tested.
- 8. Read Cycle Time is measured from the last valid address to the first transitioning address.

### TIMING WAVEFORM OF WRITE CYCLE NO. 1 ( $\overline{WE}$ CONTROLLED)<sup>(9)</sup>

#### Notes:

9.  $\overline{CE}$  and  $\overline{WE}$  must be LOW for WRITE cycle.
10. If  $\overline{CE}$  goes HIGH simultaneously with  $\overline{WE}$  HIGH, the output remains in a high impedance state.
11. Write Cycle Time is measured from the last valid address to the first transition address.

12. Transition is measured  $\pm 200\text{mV}$  from steady state voltage prior to change with specified loading in Figure 1. This parameter is sampled and not 100% tested.

**Note:**

Because of the ultra-high speed of the P4C188/L, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the  $V_{CC}$  and ground planes directly up to the contactor fingers. A 0.01  $\mu$ F high frequency

capacitor is also required between  $V_{CC}$  and ground. To avoid signal reflections, proper termination must be used; for example, a 50 $\Omega$  test environment should be terminated into a 50 $\Omega$  load with 1.73V (Thevenin Voltage) at the comparator input, and a 116 $\Omega$  resistor must be used in series with  $D_{OUT}$  to match 166 $\Omega$  (Thevenin Resistance).
