Advance Information

### 1.0 Features

- On-chip tunable voltage-controlled crystal oscillator circuitry (VCXO) allows precise system frequency tuning (pull range typically 300ppm)
- VCXO tuning range: 0-3V
- Uses inexpensive fundamental-mode crystals
- Integrated phase-locked loop (PLL) multiplies VCXO frequency to the higher system frequencies needed
- 5V supply voltage (contact factory for 3.3V)
- Small circuit board footprint (8-pin 0.150" SOIC)
- Custom frequency selections available - contact your local AMI Sales Representative for more information

### 2.0 Description

The FS6127 is a monolithic CMOS clock generator IC designed to minimize cost and component count in digital video/audio systems.

At the core of the FS6127 is circuitry that implements a voltage-controlled crystal oscillator when an external resonator (nominally 13.5MHz) is attached. The VCXO allows device frequencies to be precisely adjusted for use in systems that have frequency matching requirements, such as digital satellite receivers.

A high-resolution phase-locked loop generates the output clock frequency (CLK). The CLK frequency is phase-locked and frequency-locked to the VCXO frequency.

### 3.0 Functional Block Description

#### 3.1 Phase-Locked Loop (PLL)

The on-chip PLL is a standard frequency- and phase-locked loop architecture. The PLL multiplies the reference oscillator to the desired frequency by a ratio of integers. The frequency multiplication is exact with a zero synthesis error.

#### 3.2 Voltage-Controlled Crystal Oscillator (VCXO)

The VCXO provides a tunable, low-jitter frequency reference for the rest of the FS6127 system components. Loading capacitance for the crystal is internal to the FS6127. No external components (other than the crystal resonator itself) are required for operation of the VCXO.

Continuous fine-tuning of the VCXO frequency is accomplished by varying the voltage on the XTUNE pin. The total change (from one extreme to the other) in effective loading capacitance is t.b.d. nominal.

The oscillator operates the crystal resonator in the parallel-resonant mode. Crystal warping, or the “pulling” of the crystal oscillation frequency, is accomplished by altering the effective load capacitance presented to the crystal by

the oscillator circuit. The actual amount that changing the load capacitance alters the oscillator frequency will be dependent on the characteristics of the crystal as well as the oscillator circuit itself.

Specifically, the motional capacitance of the crystal (usually referred to by crystal manufacturers as  $C_1$ ), the static capacitance of the crystal ( $C_0$ ), and the load capacitance ( $C_L$ ) of the oscillator determine the “warping” or “pulling” capability of the crystal in the oscillator circuit.

A simple formula to obtain the warping capability of a crystal oscillator is:

$$\Delta f (ppm) = \frac{C_1 \times (C_{L2} - C_{L1}) \times 10^6}{2 \times (C_0 + C_{L2}) \times (C_0 + C_{L1})}$$

where  $C_{L1}$  and  $C_{L2}$  are the two extremes of the applied load capacitance.

EXAMPLE: A crystal with the following parameters is used. With  $C_1 = 0.02\text{pF}$ ,  $C_0 = 5\text{pF}$ ,  $C_{L1} = 10\text{pF}$ , and  $C_{L2} = 22.66\text{pF}$ , the tuning range is

$$\Delta f = \frac{0.02 \times (22.66 - 10) \times 10^6}{2 \times (5 + 22.66) \times (5 + 10)} = 305 \text{ ppm}.$$

### 4.0 Electrical Specifications

**Table 3: Absolute Maximum Ratings**

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These conditions represent a stress rating only, and functional operation of the device at these or any other conditions above the operational limits noted in this specification is not implied. Exposure to maximum rating conditions for extended conditions may affect device performance, functionality, and reliability.
