

# STM8AF51xx STM8AF6169 STM8AF617x STM8AF618x STM8AF619x STM8AF61Ax

Automotive 8-bit MCU, with up to 128 Kbytes Flash, data EEPROM, 10-bit ADC, timers, LIN, CAN, USART, SPI, I<sup>2</sup>C, 3 to 5.5 V

## Features

- Core
  - Max  $f_{CPU}$ : 24 MHz
  - Advanced STM8A core with Harvard architecture and 3-stage pipeline
  - Average 1.6 cycles/instruction resulting in 10 MIPS at 16 MHz  $f_{CPU}$  for industry standard benchmark
- Memories
  - Program memory: 32 to 128 Kbytes Flash program; data retention 20 years at 55 °C
  - Data memory: up to 2 Kbytes true data EEPROM; endurance 300 kcycles
  - RAM: 2 Kbytes to 6 Kbytes
- Clock management
  - Low-power crystal resonator oscillator with external clock input
  - Internal, user-trimmable 16 MHz RC and low-power 128 kHz RC oscillators
  - Clock security system with clock monitor
- Reset and supply management
  - Multiple low-power modes (wait, slow, auto-wakeup, halt) with user definable clock gating
  - Low consumption power-on and power-down reset
- Interrupt management
  - Nested interrupt controller with 32 interrupt vectors
  - Up to 37 external interrupts on 5 vectors
- Timers
  - 2 auto-reload 16-bit PWM timers with up to 3 CAPCOM channels each (IC, OC or PWM)
  - Multipurpose timer: 16-bit, 4 CAPCOM channels, 3 complementary outputs, dead-time insertion and flexible synchronization
  - 8-bit AR system timer with 8-bit prescaler
  - Auto-wakeup timer
  - Window and standard watchdog timers
- Operating temperature up to 145 °C

- Communication interfaces
  - High speed 1 Mbit/s active CAN 2.0B interface
  - USART with clock output for synchronous operation - LIN master mode
  - LINUART LIN 2.1 compliant, master/slave modes with automatic resynchronization
  - SPI interface up to 10 Mbit/s or  $f_{CPU}/2$
  - I<sup>2</sup>C interface up to 400 Kbit/s
- Analog to digital converter (ADC)
  - 10-bit resolution, 2 LSB TUE, 1 LSB linearity and up to 16 multiplexed channels
- I/Os
  - Up to 72 user pins including 10 high sink I/Os
  - Highly robust I/O design, immune against current injection

# 1 Introduction

This datasheet refers to the STM8AF51xx and STM8AF61xx products with 32 to 128 Kbytes of program memory. In the order code, the letter 'F' refers to product versions with Flash and data EEPROM, 'H' to product versions with Flash only, and 'P' to product versions with FASTROM. The identifiers 'F', 'H', and 'P' do not coexist in a given order code.

The datasheet contains the description of family features, pinout, electrical characteristics, mechanical data and ordering information.

- For complete information on the STM8A microcontroller memory, registers and peripherals, please refer to STM8A microcontroller family reference manual (RM0009).
- For information on programming, erasing and protection of the internal Flash memory please refer to the STM8 Flash programming manual (PM0047).
- For information on the debug and SWIM (single wire interface module) refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).
- For information on the STM8 core, please refer to the STM8 CPU programming manual (PM0044).

## 2 Description

The STM8A automotive 8-bit microcontrollers covered in this datasheet offer from 32 Kbytes to 128 Kbytes of non volatile memory and integrated true data EEPROM.

The STM8AF51xx series feature a CAN interface.

All devices of the STM8A product line provide the following benefits:

- Reduced system cost
  - Integrated true data EEPROM for up to 300 kwrite/erase cycles
  - High system integration level with internal clock oscillators, watchdog and brown-out reset
- Performance and robustness
  - Peak performance 20 MIPS at 24 MHz and average performance 10 MIPS at 16 MHz CPU clock frequency
  - Robust I/O, independent watchdogs with separate clock source
  - Clock security system
- Short development cycles
  - Applications scalability across a common family product architecture with compatible pinout, memory map and modular peripherals.
  - Full documentation and a wide choice of development tools
- Product longevity
  - Advanced core and peripherals made in a state-of-the art technology
  - Native automotive product family operating both at 3.3 V and 5 V supply

All STM8A and ST7 microcontrollers are supported by the same tools including STVD/STVP development environment, the STice emulator and a low-cost, third party in-circuit debugging tool (for more details, see [Section 14: STM8 development tools on page 110](#)).

# 4 Block diagram

Figure 1. STM8A block diagram

## 5 Product overview

This section is intended to describe the family features that are actually implemented in the products covered by this datasheet.

For more detailed information on each feature please refer to the STM8A microcontroller family reference manual (RM0009).

### 5.1 STM8A central processing unit (CPU)

The 8-bit STM8A core is a modern CISC core and has been designed for code efficiency and performance. It contains 21 internal registers (six directly addressable in each execution context), 20 addressing modes including indexed indirect and relative addressing and 80 instructions.

#### 5.1.1 Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus with single cycle fetching for most instructions
- X and Y 16-bit index registers, enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter with 16-Mbyte linear memory space
- 16-bit stack pointer with access to a 64 Kbyte stack
- 8-bit condition code register with seven condition flags for the result of the last instruction.

#### 5.1.2 Addressing

- 20 addressing modes
- Indexed indirect addressing mode for look-up tables located anywhere in the address space
- Stack pointer relative addressing mode for efficient implementation of local variables and parameter passing

#### 5.1.3 Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

## 5.2 Single wire interface module (SWIM) and debug module (DM)

### 5.2.1 SWIM

The single wire interface module, SWIM, together with an integrated debug module, permits non-intrusive, real-time in-circuit debugging and fast memory programming. The interface can be activated in all device operation modes and can be connected to a running device (hot plugging). The maximum data transmission speed is 145 bytes/ms.

### 5.2.2 Debug module

The non-intrusive debugging module features a performance close to a full-flavored emulator. Besides memory and peripheral operation, CPU operation can also be monitored in real-time by means of shadow registers.

- R/W of RAM and peripheral registers in real-time
- R/W for all resources when the application is stopped
- Breakpoints on all program-memory instructions (software breakpoints), except the interrupt vector table
- Two advanced breakpoints and 23 predefined breakpoint configurations

## 5.3 Interrupt controller

- Nested interrupts with three software priority levels
- 24 interrupt vectors with hardware priority
- Five vectors for external interrupts (up to 37 depending on the package)
- Trap and reset interrupts

## 5.4 Flash program and data EEPROM

- 32 Kbytes to 128 Kbytes of single voltage program Flash memory
- Up to 2 Kbytes true (not emulated) data EEPROM
- Read while write: Writing in the data memory is possible while executing code in the program memory
- The device setup is stored in a user option area in the non volatile memory

### 5.4.1 Architecture

- The memory is organized in blocks of 128 bytes each
- Read granularity: 1 word = 4 bytes
- Write/erase granularity: 1 word (4 bytes) or 1 block (128 bytes) in parallel
- Writing, erasing, word and block management is handled automatically by the memory interface.

### 5.4.2 Write protection (WP)

Write protection in application mode is intended to avoid unintentional overwriting of the memory. The write protection can be removed temporarily by executing a specific sequence in the user software.

### 5.4.3 Protection of user boot code (UBC)

If the user chooses to update the program memory using a specific boot code to perform in application programming (IAP), this boot code needs to be protected against unwanted modification.

In the STM8A a memory area of up to 128 Kbytes can be protected from overwriting at user option level. Other than the standard write protection, the UBC protection can exclusively be modified via the debug interface, the user software cannot modify the UBC protection status.

The UBC memory area contains the reset and interrupt vectors and its size can be adjusted in increments of 512 bytes by programming the UBC and NUBC option bytes (see [Section 9: Option bytes on page 58](#)).

**Figure 2. Flash memory organization of STM8A products**

### 5.4.4 Read-out protection (ROP)

The STM8A provides a read-out protection of the code and data memory which can be activated by an option byte setting (see the ROP option byte in section 10).

The read-out protection prevents reading and writing program memory, data memory and option bytes via the debug module and SWIM interface. This protection is active in all device operation modes. Any attempt to remove the protection by overwriting the ROP option byte triggers a global erase of the program and data memory.

The ROP circuit may provide a temporary access for debugging or failure analysis. The temporary read access is protected by a user defined, 8-byte keyword stored in the option

byte area. This keyword must be entered via the SWIM interface to temporarily unlock the device.

If desired, the temporary unlock mechanism can be permanently disabled by the user through OPT6/NOPT6 option bytes.

## 5.5 Clock controller

The clock controller distributes the system clock coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness.

### 5.5.1 Features

- **Clock sources**
  - Internal 16 MHz and 128 kHz RC oscillators
  - Crystal/resonator oscillator
  - External clock input
- **Reset:** After reset the microcontroller restarts by default with an internal 2-MHz clock (16 MHz/8). The clock source and speed can be changed by the application program as soon as the code execution starts.
- **Safe clock switching:** Clock sources can be changed safely on the fly in run mode through a configuration register. The clock signal is not switched until the new clock source is ready. The design guarantees glitch-free switching.
- **Clock management:** To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **Wakeup:** In case the device wakes up from low-power modes, the internal RC oscillator (16 MHz/8) is used for quick startup. After a stabilization time, the device switches to the clock source that was selected before halt mode was entered.
- **Clock security system (CSS):** The CSS permits monitoring of external clock sources and automatic switching to the internal RC (16 MHz/8) in case of a clock failure.
- **Configurable main clock output (CCO):** This feature permits to outputs a clock signal for use by the application.

### 5.5.2 Internal 16 MHz RC oscillator

- Default clock after reset 2 MHz (16 MHz/8)
- Fast wakeup time

#### User trimming

The register CLK\_HSITRIMR with two trimming bits plus one additional bit for the sign permits frequency tuning by the application program. The adjustment range covers all possible frequency variations versus supply voltage and temperature. This trimming does not change the initial production setting.

### 5.5.3 Internal 128 kHz RC oscillator

The frequency of this clock is 128 kHz and it is independent from the main clock. It drives the independent watchdog or the AWU wakeup timer.

In systems which do not need independent clock sources for the watchdog counters, the 128 kHz signal can be used as the system clock. This configuration has to be enabled by setting an option byte (OPT3/OPT3N, bit LSI\_EN).

### 5.5.4 Internal high-speed crystal oscillator

The internal high-speed crystal oscillator can be selected to deliver the main clock in normal run mode. It operates with quartz crystals and ceramic resonators.

- Frequency range: 1 MHz to 24 MHz
- Crystal oscillation mode: preferred fundamental
- I/Os: standard I/O pins multiplexed with OSCIN, OSCOUT

### 5.5.5 External clock input

An external clock signal can be applied to the OSCIN input pin of the crystal oscillator. The frequency range is 0 to 24 MHz.

### 5.5.6 Clock security system (CSS)

The clock security system protects against a system stall in case of an external crystal clock failure.

In case of a clock failure an interrupt is generated and the high-speed internal clock (HSI) is automatically selected with a frequency of 2 MHz (16 MHz/8).

## 5.6 Low-power operating modes

The product features various low-power modes:

- Slow mode: prescaled CPU clock, selected peripherals at full clock speed
- Active halt mode: CPU and peripheral clocks are stopped, the device cyclically goes back to run mode, controlled by the AWU timer. Wakeup through external events is possible.
- Halt mode: CPU and peripheral clocks are stopped, the device remains powered on. Wakeup is triggered by an external interrupt.

In all modes the CPU and peripherals remain permanently powered on, the system clock is applied only to selected modules. The RAM content is preserved and the brown-out reset circuit remains activated.

## 5.7 Timers

### 5.7.1 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications. The watchdog timer activity is controlled by the application program or

option bytes. Once the watchdog is activated, it cannot be disabled by the user program without going through reset.

**Window watchdog timer**

The window watchdog is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

The window function can be used to trim the watchdog behavior to match the application timing perfectly. The application software must refresh the counter before time-out and during a limited time window. If the counter is refreshed outside this time window, a reset is issued.

**Independent watchdog timer**

The independent watchdog peripheral can be used to resolve malfunctions due to hardware or software failures.

It is clocked by the 128 kHz LSI internal RC clock source, and thus stays active even in case of a CPU clock failure. If the hardware watchdog feature is enabled through the device option bits, the watchdog is automatically enabled at power-on, and generates a reset unless the key register is written by software before the counter reaches the end of count.

**5.7.2 Auto-wakeup counter**

This counter is used to cyclically wakeup the device in active halt mode. It can be clocked by the internal 128 kHz internal low-frequency RC oscillator or external clock

**5.7.3 Beeper**

This function generates a rectangular signal in the range of 1, 2 or 4 kHz which can be output on a pin. This is useful when audible sounds without interference need to be generated for use in the application.

**5.7.4 Multipurpose and PWM timers**

STM8A devices described in this datasheet, contain up to three 16-bit multipurpose and PWM timers providing nine CAPCOM channels in total. A CAPCOM channel can be used either as input compare, output compare or PWM channel. These timers are named TIM1, TIM2 and TIM3.

**Table 4. PWM timers**

Timer	Counter width	Counter type	Prescaler factor	Channels	Inverted outputs	Repetition counter	trigger unit	External trigger	Break input
TIM1	16-bit	Up/down	1 to 65536	4	3	Yes	Yes	Yes	Yes
TIM2	16-bit	Up	$2^n$ n = 0 to 15	3	None	No	No	No	No
TIM3	16-bit	Up	$2^n$ n = 0 to 15	2	None	No	No	No	No

**TIM1: Multipurpose PWM timer**

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and bridge driver.

- 16-bit up, down and up/down AR (auto-reload) counter with 16-bit fractional prescaler.
- Four independent CAPCOM channels configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- Trigger module which allows the interaction of TIM1 with other on-chip peripherals. In the present implementation it is possible to trigger the ADC upon a timer event.
- External trigger to change the timer behavior depending on external signals
- Break input to force the timer outputs into a defined state
- Three complementary outputs with adjustable dead time
- Interrupt sources: 4 x input capture/output compare, 1 x overflow/update, 1 x break

**TIM2 and TIM3: 16-bit PWM timers**

- 16-bit auto-reload up-counter
- 15-bit prescaler adjustable to fixed power of two ratios 1...32768
- Timers with three or two individually configurable CAPCOM channels
- Interrupt sources: 2 or 3 x input capture/output compare, 1 x overflow/update

**5.7.5 System timer**

The typical usage of this timer (TIM4) is the generation of a clock tick.

**Table 5. TIM4**

Timer	Counter width	Counter type	Prescaler factor	Channels	Inverted outputs	Repetition counter	trigger unit	External trigger	Break input
TIM4	8-bit	Up	2 <sup>n</sup> n = 0 to 7	0	None	No	No	No	No

- 8-bit auto-reload, adjustable prescaler ratio to any power of two from 1 to 128
- Clock source: master clock
- Interrupt source: 1 x overflow/update

## 5.8 Analog to digital converter (ADC)

The STM8A products described in this datasheet contain a 10-bit successive approximation ADC with up to 16 multiplexed input channels, depending on the package.

### ADC features:

- 10-bit resolution
- Single and continuous conversion modes
- Programmable prescaler:  $f_{\text{MASTER}}$  divided by 2 to 18
- Conversion trigger on timer events, and external events
- Interrupt generation at end of conversion
- Selectable alignment of 10-bit data in 2 x 8 bit result registers
- Shadow registers for data consistency
- ADC input range:  $V_{\text{SSA}} = V_{\text{IN}} = V_{\text{DDA}}$
- Schmitt-trigger on analog inputs can be disabled to reduce power consumption

## 5.9 Communication interfaces

### 5.9.1 Universal synchronous/asynchronous receiver transmitter (USART)

The devices covered by this datasheet contain one USART interface. The USART can operate in standard SCI mode (serial communication interface, asynchronous) or in SPI emulation mode. It is equipped with a 16 bit fractional prescaler. It features LIN master support.

Detailed feature list:

- Full duplex, asynchronous communications
- NRZ standard format (mark/space)
- High-precision baud rate generator system
  - Common programmable transmit and receive baud rates up to  $f_{\text{MASTER}}/16$
- Programmable data word length (8 or 9 bits)
- Configurable stop bits: Support for 1 or 2 stop bits
- LIN master mode:
  - LIN break and delimiter generation
  - LIN break and delimiter detection with separate flag and interrupt source for readback checking.
- Transmitter clock output for synchronous communication
- Separate enable bits for transmitter and receiver
- Transfer detection flags:
  - Receive buffer full
  - Transmit buffer empty
  - End of transmission flags
- Parity control:
  - Transmits parity bit
  - Checks parity of received data byte

- Four error detection flags:
  - Overrun error
  - Noise error
  - Frame error
  - Parity error
- Six interrupt sources with flags:
  - Transmit data register empty
  - Transmission complete
  - Receive data register full
  - Idle line received
  - Parity error
  - LIN break and delimiter detection
- Two interrupt vectors:
  - Transmitter interrupt
  - Receiver interrupt
- Reduced power consumption mode
- Wakeup from mute mode (by idle line detection or address mark detection)
- Two receiver wakeup modes:
  - Address bit (MSB)
  - Idle line

### 5.9.2 Universal asynchronous receiver/transmitter with LIN support (LINUART)

The devices covered by this datasheet contain one LINUART interface. The interface is available on all the supported packages. The LINUART is an asynchronous serial communication interface which supports extensive LIN functions tailored for LIN slave applications. In LIN mode it is compliant to the LIN standards rev 1.2 to rev 2.1.

Detailed feature list:

#### LIN mode

##### Master mode

- LIN break and delimiter generation
- LIN break and delimiter detection with separate flag and interrupt source for read back checking.

**Slave mode**

- Autonomous header handling – one single interrupt per valid header
- Mute mode to filter responses
- Identifier parity error checking
- LIN automatic resynchronization, allowing operation with internal RC oscillator (HSI) clock source
- Break detection at any time, even during a byte reception
- Header errors detection:
  - Delimiter too short
  - Synch field error
  - Deviation error (if automatic resynchronization is enabled)
  - Framing error in synch field or identifier field
  - Header time-out

**UART mode**

- Full duplex, asynchronous communications - NRZ standard format (mark/space)
- High-precision baud rate generator
  - A common programmable transmit and receive baud rates up to  $f_{\text{MASTER}}/16$
- Programmable data word length (8 or 9 bits) – 1 or 2 stop bits – parity control
- Separate enable bits for transmitter and receiver
- Error detection flags
- Reduced power consumption mode
- Multi-processor communication - enter mute mode if address match does not occur
- Wakeup from mute mode (by idle line detection or address mark detection)
- Two receiver wakeup modes:
  - Address bit (MSB)
  - Idle line

### 5.9.3 Serial peripheral interface (SPI)

The devices covered by this datasheet contain one SPI. The SPI is available on all the supported packages.

- Maximum speed: 8 Mbit/s or  $f_{\text{MASTER}}/2$  both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on two lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- CRC calculation
- 1 byte Tx and Rx buffer
- Slave mode/master mode management by hardware or software for both master and slave
- Programmable clock polarity and phase
- Programmable data order with MSB-first or LSB-first shifting
- Dedicated transmission and reception flags with interrupt capability
- SPI bus busy status flag
- Hardware CRC feature for reliable communication:
  - CRC value can be transmitted as last byte in Tx mode
  - CRC error checking for last received byte

### 5.9.4 Inter integrated circuit (I<sup>2</sup>C) interface

The devices covered by this datasheet contain one I<sup>2</sup>C interface. The interface is available on all the supported packages.

- I<sup>2</sup>C master features:
  - Clock generation
  - Start and stop generation
- I<sup>2</sup>C slave features:
  - Programmable I<sup>2</sup>C address detection
  - Stop bit detection
- Generation and detection of 7-bit/10-bit addressing and general call
- Supports different communication speeds:
  - Standard speed (up to 100 kHz),
  - Fast speed (up to 400 kHz)
- Status flags:
  - Transmitter/receiver mode flag
  - End-of-byte transmission flag
  - I<sup>2</sup>C busy flag
- Error flags:
  - Arbitration lost condition for master mode
  - Acknowledgement failure after address/data transmission
  - Detection of misplaced start or stop condition
  - Overrun/underrun if clock stretching is disabled

- Interrupt:
  - Successful address/data communication
  - Error condition
  - Wakeup from halt
- Wakeup from halt on address detection in slave mode

### 5.9.5 Controller area network interface (beCAN)

The beCAN controller (basic enhanced CAN), interfaces the CAN network and supports the CAN protocol version 2.0A and B. It is equipped with a receive FIFO and a very versatile filter bank. Together with a filter match index, this allows a very efficient message handling in today's car network architectures. The CPU is significantly unloaded. The maximum transmission speed is 1 Mbit/s.

#### Transmission

- Three transmit mailboxes
- Configurable transmit priority by identifier or order request

#### Reception

- 11- and 29-bit ID
- 1 receive FIFO (3 messages deep)
- Software-efficient mailbox mapping at a unique address space
- FMI (filter match index) stored with message for quick message association
- Configurable FIFO overrun
- Time stamp on SOF reception
- 6 filter banks, 2 x 32 bytes (scalable to 4 x 16-bit) each, enabling various masking configurations, such as 12 filters for 29-bit ID or 48 filters for 11-bit ID.
- Filtering modes (mixable):
  - Mask mode permitting ID range filtering
  - ID list mode

#### Interrupt management

- Maskable interrupt
- Software-efficient mailbox mapping at a unique address space

## 5.10 Input/output specifications

The product features four I/O types:

- Standard I/O 2 MHz
- Fast I/O up to 10 MHz
- High sink 8 mA, 2 MHz
- True open drain (I<sup>2</sup>C interface)

To decrease EMI (electromagnetic interference), high sink I/Os have a limited maximum slew rate. The rise and fall times are similar to those of standard I/Os.

The analog inputs are equipped with a low leakage analog switch. Additionally, the schmitt-trigger input stage on the analog I/Os can be disabled in order to reduce the device standby consumption.

STM8A I/Os are designed to withstand current injection. For a negative injection current of 4 mA, the resulting leakage current in the adjacent input does not exceed 1  $\mu$ A. Thanks to this feature, external protection diodes against current injection are no longer required.

# 6 Pinouts and pin description

## 6.1 Package pinouts

Figure 3. LQFP 80-pin pinout

1. The CAN interface is only available on the STM8AF/H/P51xx product line.
2. HS stands for high sink capability.

Figure 4. LQFP 64-pin pinout

1. The CAN interface is only available on the STM8AF/H/P51xx product line.
2. HS stands for high sink capability.

Figure 5. LQFP 48-pin pinout

1. The CAN interface is only available on the STM8AF/H/P51xx product line.
2. HS stands for high sink capability.

Figure 6. LQFP 32-pin pinout

1. HS stands for high sink capability.

Table 6. Legend/abbreviation for Table 7

Type	I = input, O = output, S = power supply	
Level	Input	CM = CMOS (standard for all I/Os)
	Output	HS = high sink (8 mA)
Output speed	O1 = Standard (up to 2 MHz) O2 = Fast (up to 10 MHz) O3 = Fast/slow programmability with slow as default state after reset O4 = Fast/slow programmability with fast as default state after reset	
Port and control configuration	Input	float = floating, wpu = weak pull-up
	Output	T = true open drain, OD = open drain, PP = push pull

80	64	48	32	PD7/TLI <sup>(3)</sup>	I/O	X	X	X	—	O1	X	X	Port D7	Top level interrupt	—

- In halt/active halt mode, this pin behaves as follows:
  - The input/output path is disabled.
  - If the HSE clock is used for wakeup, the internal weak pull-up is disabled.
  - If the HSE clock is off, the internal weak pull-up setting is used. It is configured through Px\_CR1[7:0] bits of the corresponding port control register. Px\_CR1[7:0] bits must be set correctly to ensure that the pin is not left floating in halt/active halt mode.
- In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer and protection diode to V<sub>DD</sub> are not implemented)
- If this pin is configured as interrupt pin, it will trigger the TLI.

## 6.2 Alternate function remapping

As shown in the rightmost column of [Table 7](#), some alternate functions can be remapped at different I/O ports by programming one of eight AFR (alternate function remap) option bits. Refer to [Section 9: Option bytes on page 58](#). When the remapping option is active, the default alternate function is no longer available.

To use an alternate function, the corresponding peripheral must be enabled in the peripheral registers.

Alternate function remapping does not effect GPIO capabilities of the I/O ports (see the GPIO section of the STM8A microcontroller family reference manual, RM0009).

# 7 Memory and register map

## 7.1 Memory map

Figure 7. Register and memory map

Table 8. Memory model 128K

Program memory size	Program memory end address	RAM size	RAM end address	Stack roll-over address
128K	27FFFh	6K	17FFh	1400h
96K	1FFFFh	6K	17FFh	1400h
64K	17FFFh	4K	0FFFh	n/a <sup>(1)</sup>
48K	13FFFh	3K	0BFFh	n/a <sup>(1)</sup>
32K	0FFFh	2K	07FFh	n/a <sup>(1)</sup>

1. if the device is containing the super set silicon (salestype contains SSS), the roll-over address is the same as on the 128K device. For more information on stack handling refer to section 2.1.2 in the reference manual RM0009. For more information on salestype composition, refer to section 13 in the present document.

## 7.2 Register map

In this section the memory and register map of the devices covered by this datasheet is described. For a detailed description of the functionality of the registers, refer to the reference manual RM009.

### 7.2.1 I/O register map

**Table 9. I/O port hardware register map**

Address	Block	Register label	Register name	Reset status
00 5000h	Port A	PA_ODR	Port A data output latch register	00h
00 5001h		PA_IDR	Port A input pin value register	00h
00 5002h		PA_DDR	Port A data direction register	00h
00 5003h		PA_CR1	Port A control register 1	00h
00 5004h		PA_CR2	Port A control register 2	00h
00 5005h	Port B	PB_ODR	Port B data output latch register	00h
00 5006h		PB_IDR	Port B input pin value register	00h
00 5007h		PB_DDR	Port B data direction register	00h
00 5008h		PB_CR1	Port B control register 1	00h
00 5009h		PB_CR2	Port B control register 2	00h
00 500Ah	Port C	PC_ODR	Port C data output latch register	00h
00 500Bh		PC_IDR	Port C input pin value register	00h
00 500Ch		PC_DDR	Port C data direction register	00h
00 500Dh		PC_CR1	Port C control register 1	00h
00 500Eh		PC_CR2	Port C control register 2	00h
00 500Fh	Port D	PD_ODR	Port D data output latch register	00h
00 5010h		PD_IDR	Port D input pin value register	00h
00 5011h		PD_DDR	Port D data direction register	00h
00 5012h		PD_CR1	Port D control register 1	02h
00 5013h		PD_CR2	Port D control register 2	00h
00 5014h	Port E	PE_ODR	Port E data output latch register	00h
00 5015h		PE_IDR	Port E input pin value register	00h
00 5016h		PE_DDR	Port E data direction register	00h
00 5017h		PE_CR1	Port E control register 1	00h
00 5018h		PE_CR2	Port E control register 2	00h

**Table 9. I/O port hardware register map (continued)**

Address	Block	Register label	Register name	Reset status
00 5019h	Port F	PF_ODR	Port F data output latch register	00h
00 501Ah		PF_IDR	Port F input pin value register	00h
00 501Bh		PF_DDR	Port F data direction register	00h
00 501Ch		PF_CR1	Port F control register 1	00h
00 501Dh		PF_CR2	Port F control register 2	00h
00 501Eh	Port G	PG_ODR	Port G data output latch register	00h
00 501Fh		PG_IDR	Port G input pin value register	00h
00 5020h		PG_DDR	Port G data direction register	00h
00 5021h		PG_CR1	Port G control register 1	00h
00 5022h		PG_CR2	Port G control register 2	00h
00 5023h	Port H	PH_ODR	Port H data output latch register	00h
00 5024h		PH_IDR	Port H input pin value register	00h
00 5025h		PH_DDR	Port H data direction register	00h
00 5026h		PH_CR1	Port H control register 1	00h
00 5027h		PH_CR2	Port H control register 2	00h
00 5028h	Port I	PI_ODR	Port I data output latch register	00h
00 5029h		PI_IDR	Port I input pin value register	00h
00 502Ah		PI_DDR	Port I data direction register	00h
00 502Bh		PI_CR1	Port I control register 1	00h
00 502Ch		PI_CR2	Port I control register 2	00h

## 7.2.2 Non volatile memory

**Table 10. Non volatile memory**

Address	Register name	7	6	5	4	3	2	1	0
00 505Ah	FLASH_CR1 Reset value	- 0	- 0	- 0	- 0	HALT 0	AHALT 0	IE 0	FIX 0

21	LINUART (SCI2)	Receive data full reg.	805Ch	—	—
22	ADC	End of conversion	8060h	—	—

Table 31. STM8A interrupt table<sup>(1)</sup> (continued)

Priority	Source block	Description	Interrupt vector address	Wakeup from halt	Comments
23	Timer 4	Update/overflow	8064h	—	—
24	EEPROM	End of programming/ write in not allowed area	8068h	—	—

1. All unused interrupts must be initialized with 'IRET' for robust programming.

## 9 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated block of the memory. Each option byte has to be stored twice, for redundancy, in a regular form (OPTx) and a complemented one (NOPTx), except for the ROP (read-out protection) option byte and option bytes 8 to 16.

Option bytes can be modified in ICP mode (via SWIM) by accessing the EEPROM address shown in [Table 32: Option bytes](#) below.

Option bytes can also be modified 'on the fly' by the application in IAP mode, except the ROP and UBC options that can only be changed in ICP mode (via SWIM).

Refer to the STM8 Flash programming manual (PM0047) and STM8 SWIM communication protocol and debug module user manual (UM0470) for information on SWIM programming procedures.

Table 32. Option bytes

Addr.	Option name	Option byte no.	Option bits								Factory default setting

Table 32. Option bytes (continued)

Addr.	Option name	Option byte no.	Option bits								Factory default setting
			7	6	5	4	3	2	1	0	
487E	Boot-loader <sup>(1)</sup>	OPT17	BL [7:0]								00h
487F		NOPT17	NBL [7:0]								00h

1. This option consists of two bytes that must have a complementary value in order to be valid. If the option is invalid, it has no effect.

**Table 33. Option byte description**

Option byte no.	Description
OPT0	<p><b>ROP[7:0]: Memory readout protection (ROP)</b>                      AAh: Enable readout protection (write access via SWIM protocol)  <i>Note: Refer to the STM8A microcontroller family reference manual (RM0009) section on Flash/EEPROM memory readout protection for details.</i></p>
OPT1	<p><b>UBC[7:0]: User boot code area</b>                      00h: No UBC, no write-protection                      01h: Page 0 to 1 defined as UBC, memory write-protected                      02h: Page 0 to 3 defined as UBC, memory write-protected                      03h to FFh: Pages 4 to 255 defined as UBC, memory write-protected  <i>Note: Refer to the STM8A microcontroller family reference manual (RM0009) section on Flash/EEPROM write protection for more details.</i></p>
OPT2	<p><b>AFR7: Alternate function remapping option 7</b>                      0: Port D4 alternate function = TIM2_CC1                      1: Port D4 alternate function = BEEP</p> <p><b>AFR6: Alternate function remapping option 6</b>                      0: Port B5 alternate function = AIN5, port B4 alternate function = AIN4                      1: Port B5 alternate function = I<sup>2</sup>C_SDA, port B4 alternate function = I<sup>2</sup>C_SCL.</p> <p><b>AFR5: Alternate function remapping option 5</b>                      0: Port B3 alternate function = AIN3, port B2 alternate function = AIN2, port B1 alternate function = AIN1, port B0 alternate function = AIN0.                      1: Port B3 alternate function = TIM1_ETR, port B2 alternate function = TIM1_NCC3, port B1 alternate function = TIM1_NCC2, port B0 alternate function = TIM1_NCC1.</p> <p><b>AFR4: Alternate function remapping option 4</b>                      0: Port D7 alternate function = TLI                      1: Reserved</p> <p><b>AFR3: Alternate function remapping option 3</b>                      0: Port D0 alternate function = TIM3_CC2                      1: Port D0 alternate function = TIM1_BKIN</p> <p><b>AFR2: Alternate function remapping option 2</b>                      0: Port D0 alternate function = TIM3_CC2                      1: Port D0 alternate function = CLK_CCO  <i>Note: AFR2 option has priority over AFR3 if both are activated</i></p> <p><b>AFR1: Alternate function remapping option 1</b>                      0: Port A3 alternate function = TIM2_CC3, port D2 alternate function TIM3_CC1.                      1: Port A3 alternate function = TIM3_CC1, port D2 alternate function TIM2_CC3.</p> <p><b>AFR0: Alternate function remapping option 0</b>                      0: Port D3 alternate function = TIM2_CC2                      1: Port D3 alternate function = ADC_ETR</p>

Table 33. Option byte description (continued)

Option byte no.	Description
OPT3	<b>LSI_EN: Low speed internal clock enable</b> 0: LSI clock is not available as CPU clock source 1: LSI clock is available as CPU clock source
	<b>IWDG_HW: Independent watchdog</b> 0: IWDG Independent watchdog activated by software 1: IWDG Independent watchdog activated by hardware
	<b>WWDG_HW: Window watchdog activation</b> 0: WWDG window watchdog activated by software 1: WWDG window watchdog activated by hardware
	<b>WWDG_HALT: Window watchdog reset on halt</b> 0: No reset generated on halt if WWDG active 1: Reset generated on halt if WWDG active
OPT4	<b>EXTCLK: External clock selection</b> 0: External crystal connected to OSCIN/OSCOU 1: External clock signal on OSCIN
	<b>CKAWUSEL: Auto-wakeup unit/clock</b> 0: LSI clock source selected for AWU 1: HSE clock with prescaler selected as clock source for AWU
	<b>PRSC[1:0]: AWU clock prescaler</b> 00: 24 MHz to 128 kHz prescaler 01: 16 MHz to 128 kHz prescaler 10: 8 MHz to 128 kHz prescaler 11: 4 MHz to 128 kHz prescaler
OPT5	<b>HSECNT[7:0]: HSE crystal oscillator stabilization time</b> This configures the stabilization time to 0.5, 8, 128, and 2048 HSE cycles with corresponding option byte values of E1h, D2h, B4h, and 00h.
OPT6	<b>TMU[3:0]: Enable temporary memory unprotection</b> 0101: TMU disabled (permanent ROP). Any other value: TMU enabled.
OPT7	<b>WAIT STATE: Wait state configuration</b> This option configures the number of wait states inserted when reading from the Flash/data EEPROM memory. 0: No wait state 1: One wait state
OPT8	<b>TMU_KEY 1 [7:0]: Temporary unprotection key 0</b> Temporary unprotection key: Must be different from 00h or FFh
OPT9	<b>TMU_KEY 2 [7:0]: Temporary unprotection key 1</b> Temporary unprotection key: Must be different from 00h or FFh
OPT10	<b>TMU_KEY 3 [7:0]: Temporary unprotection key 2</b> Temporary unprotection key: Must be different from 00h or FFh
OPT11	<b>TMU_KEY 4 [7:0]: Temporary unprotection key 3</b> Temporary unprotection key: Must be different from 00h or FFh

Table 33. Option byte description (continued)

Option byte no.	Description
OPT12	<b>TMU_KEY 5 [7:0]: Temporary unprotection key 4</b> Temporary unprotection key: Must be different from 00h or FFh
OPT13	<b>TMU_KEY 6 [7:0]: Temporary unprotection key 5</b> Temporary unprotection key: Must be different from 00h or FFh
OPT14	<b>TMU_KEY 7 [7:0]: Temporary unprotection key 6</b> Temporary unprotection key: Must be different from 00h or FFh
OPT15	<b>TMU_KEY 8 [7:0]: Temporary unprotection key 7</b> Temporary unprotection key: Must be different from 00h or FFh
OPT16	<b>TMU_MAXATT [7:0]: TMU access failure counter</b> Every unsuccessful trial to enter the temporary unprotection procedure increments the counter. More than eight unsuccessful trials trigger the global erase of the code and data memory.
OPT17	<b>BL[7:0]: Bootloader enable</b> If this option byte is set to 55h (complementary value AAh) the bootloader program is activated also in case of a programmed code memory (for more details, see the bootloader user manual, UM0500).

## 10 Electrical characteristics

### 10.1 Parameter conditions

Unless otherwise specified, all voltages are referred to  $V_{SS}$ .

#### 10.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = -40\text{ }^\circ\text{C}$ ,  $T_A = 25\text{ }^\circ\text{C}$ , and  $T_A = T_{Amax}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production.

#### 10.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^\circ\text{C}$ ,  $V_{DD} = 5.0\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range.

#### 10.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 10.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 10](#).

**Figure 10. Pin loading conditions**

### 10.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 11](#).

**Figure 11. Pin input voltage**

## 10.2 Absolute maximum ratings

Stresses above those listed as ‘absolute maximum ratings’ may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 34. Voltage characteristics**

Symbol	Ratings	Min	Max	Unit
$V_{DDx} - V_{DD}$	Supply voltage (including $V_{DDA}$ and $V_{DDIO}$ ) <sup>(1)</sup>	-0.3	6.5	V
$V_{IN}$	Input voltage on true open drain pins (PE1, PE2) <sup>(2)</sup>	$V_{SS} - 0.3$	6.5	V
	Input voltage on any other pin <sup>(2)</sup>	$V_{SS} - 0.3$	$V_{DD} + 0.3$	
$ V_{DDx} - V_{DD} $	Variations between different power pins	—	50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins	—	50	
$V_{ESD}$	Electrostatic discharge voltage	see <a href="#">Absolute maximum ratings (electrical sensitivity) on page 93</a>		

1. All power ( $V_{DD}$ ,  $V_{DDIO}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSIO}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply

2.  $I_{IN(PIN)}$  must never be exceeded. This is implicitly insured if  $V_{IN}$  maximum is respected. If  $V_{IN}$  maximum cannot be respected, the injection current must be limited externally to the  $I_{IN(PIN)}$  value. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ . For true open-drain pads, there is no positive injection current, and the corresponding  $V_{IN}$  maximum must always be respected

**Table 35. Current characteristics**

Symbol	Ratings	Max.	Unit
$I_{VDDIO}$	Total current into $V_{DDIO}$ power lines (source) <sup>(1)(2)(3)</sup>	100	mA
$I_{VSSIO}$	Total current out of $V_{SSIO}$ ground lines (sink) <sup>(1)(2)(3)</sup>	100	
$I_{IO}$	Output current sunk by any I/O and control pin	20	
	Output current source by any I/Os and control pin	-20	
$I_{INJ(PIN)}^{(4)}$	Injected current on any pin	±10	
$I_{INJ(TOT)}$	Sum of injected currents	50	

1. All power ( $V_{DD}$ ,  $V_{DDIO}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSIO}$ ,  $V_{SSA}$ ) pins must always be connected to the external supply.
2. The total limit applies to the sum of operation and injected currents.
3.  $V_{DDIO}$  includes the sum of the positive injection currents.  $V_{SSIO}$  includes the sum of the negative injection currents.
4. This condition is implicitly insured if  $V_{IN}$  maximum is respected. If  $V_{IN}$  maximum cannot be respected, the injection current must be limited externally to the  $I_{INJ(PIN)}$  value. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ . For true open-drain pads, there is no positive injection current allowed and the corresponding  $V_{IN}$  maximum must always be respected.

**Table 36. Thermal characteristics**

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	-65 to 150	°C
$T_J$	Maximum junction temperature	160	

### 10.3 Operating conditions

**Table 37. General operating conditions**

Symbol	Parameter	Conditions	Min	Max	Unit
f <sub>CPU</sub>	Internal CPU clock frequency	1 wait state T <sub>A</sub> = -40 °C to 145 °C	16	24 <sup>(1)</sup>	MHz
		0 wait state T <sub>A</sub> = -40 °C to 145 °C	0	16	
V <sub>DD</sub> /V <sub>DDIO</sub>	Standard operating voltage	—	3.0	5.5	V
C <sub>EXT</sub>	V <sub>CAP</sub> external capacitor <sup>(2)</sup>	ESR ≤ 0.3 Ω at 1 MHz	470	3300	nF
T <sub>A</sub>	Ambient temperature	Suffix A	-40	85	°C
		Suffix B		105	
		Suffix C		125	
		Suffix D		145	
T <sub>J</sub>	Junction temperature range	A suffix version		90	
		B suffix version		110	
		C suffix version		130	
		D suffix version		150	

- For devices with less than 96 Kbyte of program memory, the 24 MHz are only achievable using the super set silicon (salestype contains SSS)
- Care should be taken when selecting the capacitor, due to its tolerance, as well as its dependency on temperature, DC bias and frequency in addition to other factors. 470 nF ± 10 % is acceptable, taking into account all tolerances.

**Figure 12. f<sub>CPUmax</sub> versus V<sub>DD</sub>**

- For devices with less than 96 Kbyte of program memory, the 24 MHz are only achievable using the super set silicon (salestype contains SSS)

**Table 38. Operating conditions at power-up/power-down**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{VDD}$	$V_{DD}$ rise time rate	—	2 <sup>(1)</sup>	—	$\infty$	$\mu\text{s/V}$
	$V_{DD}$ fall time rate	—	2 <sup>(1)</sup>	—	$\infty$	
$t_{TEMP}$	Reset release delay	$V_{DD}$ rising	—	3	—	ms
	Reset generation delay	$V_{DD}$ falling	—	3	—	$\mu\text{s}$
$V_{IT+}$	Power-on reset threshold <sup>(2)</sup>	—	2.65	2.8	2.95	V
$V_{IT-}$	Brown-out reset threshold	—	2.58	2.73	2.88	
$V_{HYS(BOR)}$	Brown-out reset hysteresis	—	—	70 <sup>(1)</sup>		mV

1. Guaranteed by design, not tested in production.
2. If  $V_{DD}$  is below 3 V, the code execution is guaranteed above the  $V_{IT-}$  and  $V_{IT+}$  thresholds. RAM content is kept. The EEPROM programming sequence must not be initiated.

### 10.3.1 VCAP external capacitor

Stabilization for the main regulator is achieved connecting an external capacitor  $C_{EXT}$  to the  $V_{CAP}$  pin.  $C_{EXT}$  is specified in [Table 37](#). Care should be taken to limit the series inductance to less than 15 nH.

**Figure 13. External capacitor  $C_{EXT}$**

1. Legend: ESR is the equivalent series resistance and ESL is the equivalent inductance.

### 10.3.2 Supply current characteristics

The current consumption is measured as described in [Figure 10 on page 64](#) and [Figure 11 on page 65](#).

If not explicitly stated, general conditions of temperature and voltage apply.

**Table 39. Total current consumption in run, wait and slow mode. General conditions for  $V_{DD}$  apply.  $T_A = -40\text{ }^{\circ}\text{C}$  to  $145\text{ }^{\circ}\text{C}$**

Symbol	Parameter	Conditions	Typ	Max	Unit	
$I_{DD(RUN)}^{(1)}$	Supply current in run mode	All peripherals clocked, code executed from EEPROM, HSE external clock	$f_{CPU} = 24\text{ MHz}$ 1 ws	8.7	16.8 <sup>(2)(3)</sup>	mA
			$f_{CPU} = 16\text{ MHz}$	7.4	14	
			$f_{CPU} = 8\text{ MHz}$	4.0	7.4 <sup>(2)</sup>	
			$f_{CPU} = 4\text{ MHz}$	2.4	4.1 <sup>(2)</sup>	
			$f_{CPU} = 2\text{ MHz}$	1.5	2.5	
$I_{DD(RUN)}^{(1)}$	Supply current in run mode	All peripherals clocked, code executed from RAM, HSE external clock	$f_{CPU} = 24\text{ MHz}$	4.4	6.0 <sup>(2)(3)</sup>	
			$f_{CPU} = 16\text{ MHz}$	3.7	5.0	
			$f_{CPU} = 8\text{ MHz}$	2.2	3.0 <sup>(2)</sup>	
			$f_{CPU} = 4\text{ MHz}$	1.4	2.0 <sup>(2)</sup>	
			$f_{CPU} = 2\text{ MHz}$	1.0	1.5	
$I_{DD(WFI)}^{(1)}$	Supply current in wait mode	CPU stopped, all peripherals off, HSE external clock	$f_{CPU} = 24\text{ MHz}$	2.4	3.1 <sup>(2)(3)</sup>	
			$f_{CPU} = 16\text{ MHz}$	1.65	2.5	
			$f_{CPU} = 8\text{ MHz}$	1.15	1.9 <sup>(2)</sup>	
			$f_{CPU} = 4\text{ MHz}$	0.90	1.6 <sup>(2)</sup>	
			$f_{CPU} = 2\text{ MHz}$	0.80	1.5	
$I_{DD(SLOW)}^{(1)}$	Supply current in slow mode	$f_{CPU}$ scaled down, all peripherals off, code executed from RAM	External clock 16 MHz $f_{CPU} = 125\text{ kHz}$	1.50	1.95	
			LSI internal RC $f_{CPU} = 128\text{ kHz}$	1.50	1.80 <sup>(2)</sup>	

1. The current due to I/O utilization is not taken into account in these values.
2. Values not tested in production. Design guidelines only.
3. For devices with less than 96 Kbyte of program memory, the 24 MHz are only achievable using the super set silicon (salestype contains SSS)

**Table 40. Total current consumption in halt and active halt modes. General conditions for  $V_{DD}$  apply.  $T_A = -40\text{ }^{\circ}\text{C}$  to  $55\text{ }^{\circ}\text{C}$  unless otherwise stated**

Symbol	Parameter	Conditions	Typ	Max	Unit
$I_{DD(H)}$	Supply current in halt mode	Clocks stopped, Flash in power-down mode	5	35 <sup>(1)</sup>	$\mu\text{A}$
		Clocks stopped, Flash in power-down mode, $T_A = 25\text{ }^{\circ}\text{C}$	5	25	
$I_{DD(FAH)}$	Supply current in fast active halt mode	External clock 16 MHz $f_{MASTER} = 125\text{ kHz}$	770	900 <sup>(1)</sup>	
		LSI clock 128 kHz	150	230 <sup>(1)</sup>	
$I_{DD(SAH)}$	Supply current in slow active halt mode	LSI clock 128 kHz	25	42 <sup>(1)</sup>	
		LSI clock 128 kHz, $T_A = 25\text{ }^{\circ}\text{C}$	25	30	
$t_{WU(FAH)}$	Wakeup time from fast active halt mode	$T_A = -40\text{ }^{\circ}\text{C}$ to $145\text{ }^{\circ}\text{C}$	10	30 <sup>(1)</sup>	$\mu\text{s}$
$t_{WU(SAH)}$	Wakeup time from slow active halt mode		50	80 <sup>(1)</sup>	

1. Data based on characterization results. Not tested in production.

### Current consumption for on-chip peripherals

**Table 41. Oscillator current consumption**

Symbol	Parameter	Conditions	Typ	Max <sup>(1)</sup>	Unit	
$I_{DD(OSC)}$	HSE oscillator current consumption <sup>(2)</sup>	Quartz or ceramic resonator, CL = 33 pF $V_{DD} = 5\text{ V}$	$f_{OSC} = 24\text{ MHz}$	1	2.0 <sup>(3)</sup>	$\text{mA}$
			$f_{OSC} = 16\text{ MHz}$	0.6	—	
			$f_{OSC} = 8\text{ MHz}$	0.57	—	
$I_{DD(OSC)}$	HSE oscillator current consumption <sup>(2)</sup>	Quartz or ceramic resonator, CL = 33 pF $V_{DD} = 3.3\text{ V}$	$f_{OSC} = 24\text{ MHz}$	0.5	1.0 <sup>(3)</sup>	
			$f_{OSC} = 16\text{ MHz}$	0.25	—	
			$f_{OSC} = 8\text{ MHz}$	0.18	—	

- During startup, the oscillator current consumption may reach 6 mA.
- The supply current of the oscillator can be further optimized by selecting a high quality resonator with small  $R_m$  value. Refer to crystal manufacturer for more details
- Informative data.

**Table 42. Programming current consumption**

Symbol	Parameter	Conditions	Typ	Max	Unit
$I_{DD(PROG)}$	Programming current	$V_{DD} = 5\text{ V}$ , $-40\text{ }^{\circ}\text{C}$ to $145\text{ }^{\circ}\text{C}$ , erasing and programming data or program memory	1.0	1.7	$\text{mA}$

**Table 43. Typical peripheral current consumption  $V_{DD} = 5.0\text{ V}^{(1)}$**

Symbol	Parameter	Typ. $f_{\text{master}} = 2\text{ MHz}$	Typ. $f_{\text{master}} = 16\text{ MHz}$	Typ. $f_{\text{master}} = 24\text{ MHz}$	Unit
$I_{DD}(\text{TIM1})$	TIM1 supply current <sup>(2)</sup>	0.03	0.23	0.34	mA
$I_{DD}(\text{TIM2})$	TIM2 supply current <sup>(2)</sup>	0.02	0.12	0.19	
$I_{DD}(\text{TIM3})$	TIM3 supply current <sup>(2)</sup>	0.01	0.1	0.16	
$I_{DD}(\text{TIM4})$	TIM4 supply current <sup>(2)</sup>	0.004	0.03	0.05	
$I_{DD}(\text{USART})$	USART supply current <sup>(2)</sup>	0.03	0.09	0.15	
$I_{DD}(\text{LINUART})$	LINUART supply current <sup>(2)</sup>	0.03	0.11	0.18	
$I_{DD}(\text{SPI})$	SPI supply current <sup>(2)</sup>	0.01	0.04	0.07	
$I_{DD}(\text{I}^2\text{C})$	I <sup>2</sup> C supply current <sup>(2)</sup>	0.02	0.06	0.91	
$I_{DD}(\text{CAN})$	CAN supply current <sup>(3)</sup>	0.06	0.30	0.40	
$I_{DD}(\text{AWU})$	AWU supply current <sup>(2)</sup>	0.003	0.02	0.05	
$I_{DD}(\text{TOT\_DIG})$	All digital peripherals on	0.22	1	2.4	
$I_{DD}(\text{ADC})$	ADC supply current when converting <sup>(4)</sup>	0.93	0.95	0.96	

1. Typical values not tested in production. Since the peripherals are powered by an internally regulated, constant digital supply voltage, the values are similar in the full supply voltage range.
2. Data based on a differential  $I_{DD}$  measurement between no peripheral clocked and a single active peripheral. This measurement does not include the pad toggling consumption.
3. Data based on a differential  $I_{DD}$  measurement between reset configuration (CAN disabled) and a permanent CAN data transmit sequence in loopback mode at 1 MHz. This measurement does not include the pad toggling consumption.
4. Data based on a differential  $I_{DD}$  measurement between reset configuration and continuous A/D conversions.

**Current consumption curves**

Figure 14 to Figure 19 show typical current consumption measured with code executing in RAM.

### 10.3.3 External clock sources and timing characteristics

#### HSE external clock

An HSE clock can be generated by feeding an external clock signal of up to 24 MHz to the OSCIN pin.

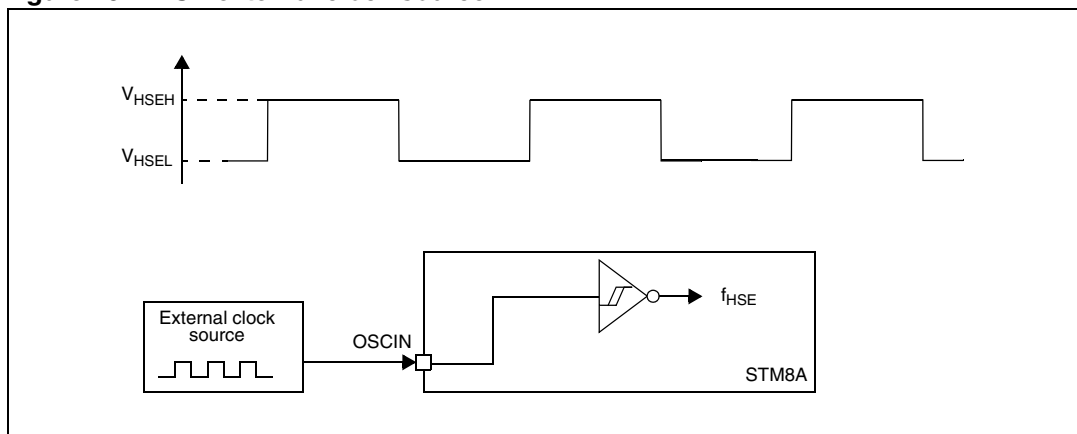

Clock characteristics are subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

**Table 44. HSE external clock characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE\_ext}$	User external clock source frequency	$T_A = -40\text{ }^\circ\text{C to } 145\text{ }^\circ\text{C}$	0 <sup>(1)</sup>	—	24 <sup>(2)</sup>	MHz
$V_{HSEdHL}$	Comparator hysteresis	—	$0.1 \times V_{DD}$	—	—	V
$V_{HSEH}$	OSCIN high-level input pin voltage	—	$0.7 \times V_{DD}$	—	$V_{DD}$	
$V_{HSEL}$	OSCIN low-level input pin voltage	—	$V_{SS}$	—	$0.3 \times V_{DD}$	
$I_{LEAK\_HSE}$	OSCIN input leakage current	$V_{SS} < V_{IN} < V_{DD}$	-1	—	+1	$\mu\text{A}$

1. If CSS is used, the external clock must have a frequency above 500 kHz.
2. For devices with less than 96 Kbyte of program memory, the 24 MHz are only achievable using the super set silicon (salestype contains SSS)

**Figure 20. HSE external clock source**

#### HSE crystal/ceramic resonator oscillator

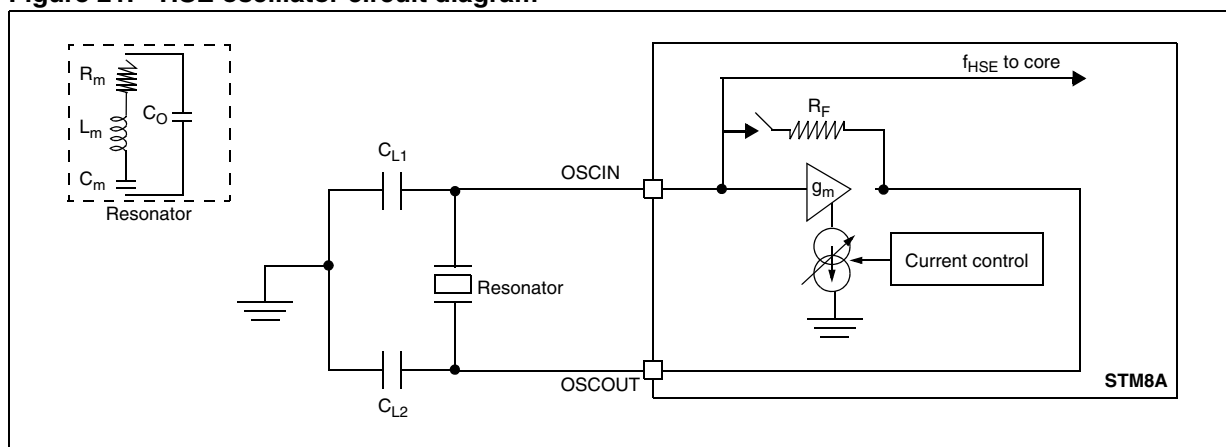

The HSE clock can be supplied using a crystal/ceramic resonator oscillator of up to 24 MHz. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

**Table 45. HSE oscillator characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_F$	Feedback resistor	—	—	220	—	k $\Omega$
$C_{L1}/C_{L2}^{(1)}$	Recommended load capacitance	—	—	—	20	pF
$g_m$	Oscillator trans conductance	—	5	—	—	mA/V
$t_{SU(HSE)}^{(2)}$	Startup time	$V_{DD}$ is stabilized	—	2.8	—	ms

1. The oscillator needs two load capacitors,  $C_{L1}$  and  $C_{L2}$ , to act as load for the crystal. The total load capacitance (Cload) is  $(C_{L1} * C_{L2}) / (C_{L1} + C_{L2})$ . If  $C_{L1} = C_{L2}$ , Cload =  $C_{L1}/2$ . Some oscillators have built-in load capacitors,  $C_{L1}$  and  $C_{L2}$ .
2. This value is the startup time, measured from the moment it is enabled (by software) until a stabilized 24 MHz oscillation is reached. It can vary with the crystal type that is used.

**Figure 21. HSE oscillator circuit diagram**

**HSE oscillator critical  $g_m$  formula**

The crystal characteristics have to be checked with the following formula:

**Equation 1**

$$g_m \gg g_{m\text{crit}}$$

where  $g_{m\text{crit}}$  can be calculated with the crystal parameters as follows:

**Equation 2**

$$g_{m\text{crit}} = (2 \times \Pi \times f_{\text{HSE}})^2 \times R_m(2C_o + C)^2$$

- $R_m$ : Notional resistance (see crystal specification)
- $L_m$ : Notional inductance (see crystal specification)
- $C_m$ : Notional capacitance (see crystal specification)
- $C_o$ : Shunt capacitance (see crystal specification)
- $C_{L1} = C_{L2} = C$ : Grounded external capacitance

### 10.3.4 Internal clock sources and timing characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

#### High-speed internal RC oscillator (HSI)

**Table 46. HSI oscillator characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSI}$	Frequency	—	—	16	—	MHz
$ACC_{HS}$	HSI oscillator user trimming accuracy	Trimmed by the application for any $V_{DD}$ and $T_A$ conditions	-1	—	1	%
	HSI oscillator accuracy (factory calibrated)	$V_{DD} = 3.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ , $-40\text{ }^\circ\text{C} \leq T_A \leq 145\text{ }^\circ\text{C}$	-5	—	5	
$t_{su(HSI)}$	HSI oscillator wakeup time	—	—	—	2 <sup>(1)</sup>	$\mu\text{s}$

1. Guaranteed by characterization, not tested in production

**Figure 22. Typical HSI frequency vs  $V_{DD}$**

**Low-speed internal RC oscillator (LSI)**

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

**Table 47. LSI oscillator characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSI}$	Frequency	—	112	128	144	kHz
$t_{su(LSI)}$	LSI oscillator wakeup time	—	—	—	7 <sup>(1)</sup>	$\mu s$

1. Data based on characterization results, not tested in production.

**Figure 23. Typical LSI frequency vs  $V_{DD}$**

### 10.3.5 Memory characteristics

#### Flash program memory/data EEPROM memory

General conditions:  $T_A = -40\text{ }^{\circ}\text{C}$  to  $145\text{ }^{\circ}\text{C}$ .

**Table 48. Flash program memory/data EEPROM memory**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max	Unit
$V_{DD}$	Operating voltage (all modes, execution/write/erase)	$f_{CPU}$ is 16 to 24 MHz with 1 ws <sup>(2)</sup> $f_{CPU}$ is 0 to 16 MHz with 0 ws	3.0	—	5.5	V
$V_{DD}$	Operating voltage (code execution)	$f_{CPU}$ is 16 to 24 MHz with 1 ws <sup>(2)</sup> $f_{CPU}$ is 0 to 16 MHz with 0 ws	2.6	—	5.5	
$t_{prog}$	Standard programming time (including erase) for byte/word/block (1 byte/4 bytes/128 bytes)	—	—	6	6.6	ms
	Fast programming time for 1 block (128 bytes)	—	—	3	3.3	
$t_{erase}$	Erase time for 1 block (128 bytes)	—	—	3	3.3	ms

1. Guaranteed by characterization, not tested in production.
2. For devices with less than 96 Kbyte of program memory, the 24 MHz are only achievable using the super set silicon (salestype contains SSS)

**Table 49. Program memory**

Symbol	Parameter	Condition	Min	Max	Unit
$T_{WE}$	Temperature for writing and erasing	—	-40	125	$^{\circ}\text{C}$
$N_{WE}$	Program memory endurance (erase/write cycles) <sup>(1)</sup>	$T_A = 25\text{ }^{\circ}\text{C}$	1000	—	cycles
$t_{RET}$	Data retention time	$T_A = 25\text{ }^{\circ}\text{C}$	40	—	years
		$T_A = 55\text{ }^{\circ}\text{C}$	20	—	

1. The physical granularity of the memory is four bytes, so cycling is performed on four bytes even when a write/erase operation addresses a single byte.

**Table 50. Data memory**

Symbol	Parameter	Condition	Min	Max	Unit
$T_{WE}$	Temperature for writing and erasing	—	-40	125	°C
				145 <sup>(1)</sup>	
$N_{WE}$	Data memory endurance <sup>(2)</sup> (erase/write cycles)	$T_A = 25\text{ °C}$	300 k	—	cycles
		$T_A = -40\text{ °C to }125\text{ °C}$	100 k <sup>(3)</sup>	—	
$t_{RET}$	Data retention time	$T_A = 25\text{ °C}$	40 <sup>(3)(4)</sup>	—	years
		$T_A = 55\text{ °C}$	20 <sup>(3)(4)</sup>	—	

1. Target value, to be confirmed.
2. The physical granularity of the memory is four bytes, so cycling is performed on four bytes even when a write/erase operation addresses a single byte.
3. More information on the relationship between data retention time and number of write/erase cycles is available in a separate technical document.
4. Retention time for 256B of data memory after up to 1000 cycles at 125 °C.

### 10.3.6 I/O port pin characteristics

#### General characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified. All unused pins must be kept at a fixed voltage, using the output mode of the I/O for example or an external pull-up or pull-down resistor.

**Table 51. I/O static characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL}$	Low-level input voltage	—	-0.3 V		$0.3 \times V_{DD}$	—
$V_{IH}$	High-level input voltage		$0.7 \times V_{DD}$		$V_{DD} + 0.3 \text{ V}$	
$V_{hys}$	Hysteresis <sup>(1)</sup>		—	$0.1 \times V_{DD}$	—	
$V_{OH}$	High-level output voltage	Standard I/O, $V_{DD} = 5 \text{ V}$ , $I = 3 \text{ mA}$	$V_{DD} - 0.5 \text{ V}$	—	—	—
		Standard I/O, $V_{DD} = 3 \text{ V}$ , $I = 1.5 \text{ mA}$	$V_{DD} - 0.4 \text{ V}$	—	—	
$V_{OL}$	Low-level output voltage	High sink and true open drain I/O, $V_{DD} = 5 \text{ V}$ $I = 8 \text{ mA}$	—	—	0.5	V
		Standard I/O, $V_{DD} = 5 \text{ V}$ $I = 3 \text{ mA}$	—	—	0.6	
		Standard I/O, $V_{DD} = 3 \text{ V}$ $I = 1.5 \text{ mA}$	—	—	0.4	
$R_{pu}$	Pull-up resistor	$V_{DD} = 5 \text{ V}$ , $V_{IN} = V_{SS}$	35	50	65	k $\Omega$
$t_R, t_F$	Rise and fall time (10% - 90%)	Fast I/Os Load = 50 pF	—	—	20 <sup>(2)</sup>	ns
		Standard and high sink I/Os Load = 50 pF	—	—	125 <sup>(2)</sup>	
$I_{lkg}$	Digital input pad leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$	—	—	$\pm 1$	$\mu\text{A}$
$I_{lkg \text{ ana}}$	Analog input pad leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$ $-40 \text{ }^\circ\text{C} < T_A < 125 \text{ }^\circ\text{C}$	—	—	$\pm 250$	nA
		$V_{SS} \leq V_{IN} \leq V_{DD}$ $-40 \text{ }^\circ\text{C} < T_A < 145 \text{ }^\circ\text{C}$	—	—	$\pm 500$	
$I_{lkg(inj)}$	Leakage current in adjacent I/O <sup>(2)</sup>	Injection current $\pm 4 \text{ mA}$	—	—	$\pm 1$ <sup>(2)</sup>	$\mu\text{A}$
$I_{DDIO}$	Total current on either $V_{DDIO}$ or $V_{SSIO}$	Including injection currents	—	—	60	mA

1. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results, not tested in production.
2. Data based on characterization results, not tested in production.

Figure 24. Typical  $V_{IL}$  and  $V_{IH}$  vs  $V_{DD}$  @ four temperatures

Figure 25. Typical pull-up resistance  $R_{PU}$  vs  $V_{DD}$  @ four temperatures

Figure 26. Typical pull-up current  $I_{PU}$  vs  $V_{DD}$  @ four temperatures<sup>(1)</sup>

1. The pull-up is a pure resistor (slope goes through 0).

Typical output level curves

Figure 27 to Figure 36 show typical output level curves measured with output on a single pin.

Figure 27. Typ.  $V_{OL}$  @  $V_{DD} = 3.3$  V (standard ports)

Figure 28. Typ.  $V_{OL}$  @  $V_{DD} = 5.0$  V (standard ports)

Figure 29. Typ.  $V_{OL}$  @  $V_{DD} = 3.3$  V (true open drain ports)

### 10.3.7 Reset pin characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified.

**Table 52. NRST pin characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$	NRST low-level input voltage <sup>(1)</sup>	—	$V_{SS}$	—	$0.3 \times V_{DD}$	—
$V_{IH(NRST)}$	NRST high-level input voltage <sup>(1)</sup>	—	$0.7 \times V_{DD}$	—	$V_{DD}$	—
$V_{OL(NRST)}$	NRST low-level output voltage <sup>(1)</sup>	$I_{OL} = 3 \text{ mA}$		—	0.6	V
$R_{PU(NRST)}$	NRST pull-up resistor	—	30	40	60	$k\Omega$
$V_{F(NRST)}$	NRST input filtered pulse <sup>(1)</sup>	—	85	—	315	ns

1. Data based on characterization results, not tested in production.

**Figure 37. Typical NRST  $V_{IL}$  and  $V_{IH}$  vs  $V_{DD}$  @ four temperatures**

Figure 38. Typical NRST pull-up resistance  $R_{PU}$  vs  $V_{DD}$

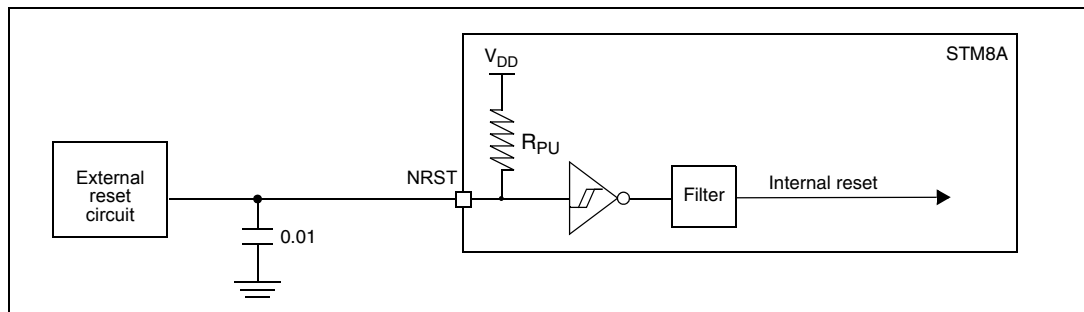

Figure 39. Typical NRST pull-up current  $I_{PU}$  vs  $V_{DD}$

The reset network shown in [Figure 40](#) protects the device against parasitic resets.

Figure 40. Recommended reset pin protection

### 10.3.8 TIM 1, 2, 3, and 4 electrical specifications

Subject to general operating conditions for  $V_{DD}$ ,  $f_{MASTER}$  and  $T_A$ .

**Table 53. TIM 1, 2, 3, and 4 electrical specifications**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{EXT}$	Timer external clock frequency <sup>(1)</sup>	—	—	—	24	MHz

1. Not tested in production. For devices with less than 96 Kbyte of program memory, the 24 MHz are only achievable using the super set silicon (salestype contains SSS).

### 10.3.9 SPI interface

Unless otherwise specified, the parameters given in [Table 54](#) are derived from tests performed under ambient temperature,  $f_{\text{MASTER}}$  frequency, and  $V_{\text{DD}}$  supply voltage conditions.  $t_{\text{MASTER}} = 1/f_{\text{MASTER}}$ .

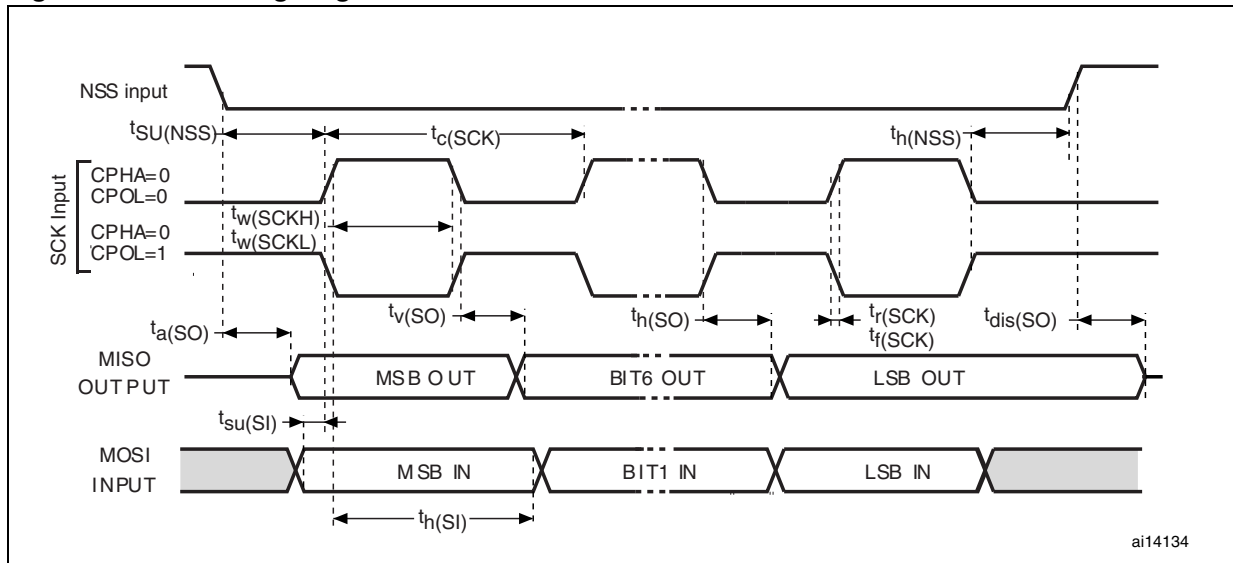

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

**Table 54. SPI characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit	
$f_{\text{SCK}}$ $1/t_{\text{c(SCK)}}$	SPI clock frequency	Master mode	0	10	MHz	
		Slave mode	$V_{\text{DD}} < 4.5 \text{ V}$	0		6 <sup>(1)</sup>
			$V_{\text{DD}} = 4.5 \text{ V to } 5.5 \text{ V}$	0		8 <sup>(1)</sup>
$t_{\text{r(SCK)}}$ $t_{\text{f(SCK)}}$	SPI clock rise and fall time	Capacitive load: $C = 30 \text{ pF}$	—	25 <sup>(2)</sup>	ns	
$t_{\text{su(NSS)}}^{(3)}$	NSS setup time	Slave mode	$4 * t_{\text{MASTER}}$	—		
$t_{\text{h(NSS)}}^{(3)}$	NSS hold time	Slave mode	70	—		
$t_{\text{w(SCKH)}}^{(3)}$ $t_{\text{w(SCKL)}}^{(3)}$	SCK high and low time	Master mode, $f_{\text{MASTER}} = 8 \text{ MHz}, f_{\text{SCK}} = 4 \text{ MHz}$	110	140		
$t_{\text{su(MI)}}^{(3)}$ $t_{\text{su(SI)}}^{(3)}$	Data input setup time	Master mode	5	—		
		Slave mode	5	—		
$t_{\text{h(MI)}}^{(3)}$ $t_{\text{h(SI)}}^{(3)}$	Data input hold time	Master mode	7	—		
		Slave mode	10	—		
$t_{\text{a(SO)}}^{(3)(4)}$	Data output access time	Slave mode	—	$3 * t_{\text{MASTER}}$		
$t_{\text{dis(SO)}}^{(3)(5)}$	Data output disable time	Slave mode	25	—		
$t_{\text{v(SO)}}^{(3)}$	Data output valid time	Slave mode (after enable edge)	$V_{\text{DD}} < 4.5 \text{ V}$	75		
		$V_{\text{DD}} = 4.5 \text{ V to } 5.5 \text{ V}$	53			
$t_{\text{v(MO)}}^{(3)}$	Data output valid time	Master mode (after enable edge)	—	30		
$t_{\text{h(SO)}}^{(3)}$ $t_{\text{h(MO)}}^{(3)}$	Data output hold time	Slave mode (after enable edge)	31	—		
		Master mode (after enable edge)	12	—		

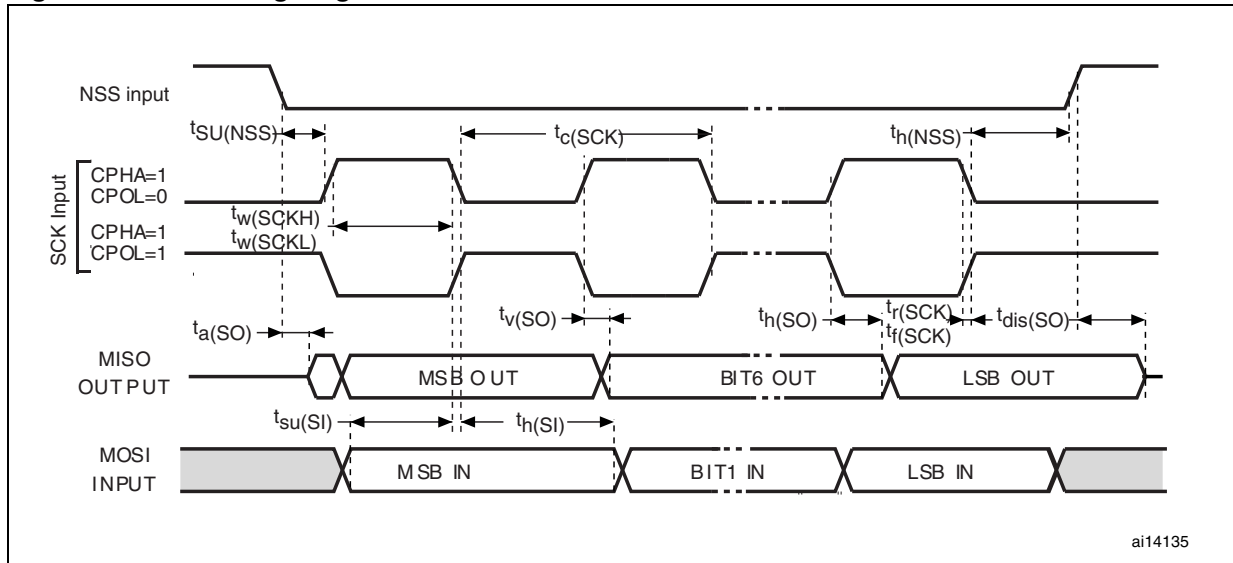

- $f_{\text{MAX}}$  is  $f_{\text{MASTER}}/2$ .
- The pad has to be configured accordingly (fast mode).
- Values based on design simulation and/or characterization results, and not tested in production.
- Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.
- Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

t <sub>w(SCLL)</sub>	SCL clock low time	4.7	—	1.3	—	μs
t <sub>w(SCLH)</sub>	SCL clock high time	4.0	—	0.6	—	
t <sub>su(SDA)</sub>	SDA setup time	250	—	100	—	ns
t <sub>h(SDA)</sub>	SDA data hold time	0 <sup>(3)</sup>	—	0 <sup>(4)</sup>	900 <sup>(3)</sup>	
t <sub>r(SDA)</sub> t <sub>r(SCL)</sub>	SDA and SCL rise time (V <sub>DD</sub> 3 V to 5.5 V)	—	1000	—	300	
t <sub>f(SDA)</sub> t <sub>f(SCL)</sub>	SDA and SCL fall time (V <sub>DD</sub> 3 V to 5.5 V)	—	300	—	300	
t <sub>h(STA)</sub>	START condition hold time	4.0	—	0.6	—	μs
t <sub>su(STA)</sub>	Repeated START condition setup time	4.7	—	0.6	—	
t <sub>su(STO)</sub>	STOP condition setup time	4.0	—	0.6	—	μs
t <sub>w(STO:STA)</sub>	STOP to START condition time (bus free)	4.7	—	1.3	—	μs
C <sub>b</sub>	Capacitive load for each bus line	—	400	—	400	pF

1. f<sub>MASTER</sub>, must be at least 8 MHz to achieve max fast I<sup>2</sup>C speed (400 kHz)
2. Data based on standard I<sup>2</sup>C protocol requirement, not tested in production
3. The maximum hold time of the start condition has only to be met if the interface does not stretch the low time
4. The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL

### 10.3.11 10-bit ADC characteristics

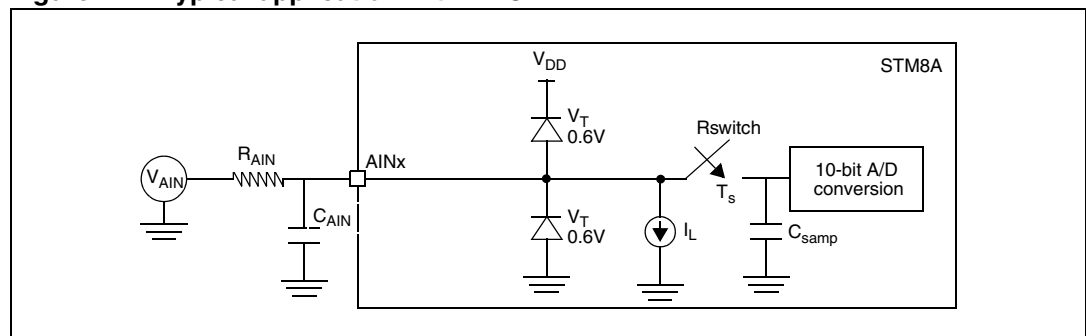

Subject to general operating conditions for  $V_{DDA}$ ,  $f_{MASTER}$  and  $T_A$  unless otherwise specified.

**Table 56. ADC characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{ADC}$	ADC clock frequency	—	111 kHz	—	4 MHz	kHz/MHz
$V_{DDA}$	Analog supply	—	3	—	5.5	V
$V_{REF+}$	Positive reference voltage	—	2.75	—	$V_{DDA}$	
$V_{REF-}$	Negative reference voltage	—	$V_{SSA}$	—	0.5	
$V_{AIN}$	Conversion voltage range <sup>(1)</sup>	—	$V_{SSA}$	—	$V_{DDA}$	
		Devices with external $V_{REF+}/V_{REF-}$ pins	$V_{REF-}$	—	$V_{REF+}$	
$C_{s\text{amp}}$	Internal sample and hold capacitor	—	—	—	3	pF
$t_S^{(1)}$	Sampling time ( $3 \times 1/f_{ADC}$ )	$f_{ADC} = 2 \text{ MHz}$	—	1.5	—	$\mu\text{s}$
		$f_{ADC} = 4 \text{ MHz}$	—	0.75	—	
$t_{STAB}$	Wakeup time from standby	$f_{ADC} = 2 \text{ MHz}$	—	7	—	
		$f_{ADC} = 4 \text{ MHz}$	—	3.5	—	
$t_{CONV}$	Total conversion time including sampling time ( $14 \times 1/f_{ADC}$ )	$f_{ADC} = 2 \text{ MHz}$	—	7	—	
		$f_{ADC} = 4 \text{ MHz}$	—	3.5	—	
$R_{\text{switch}}$	Equivalent switch resistance	—	—	—	30	k $\Omega$

1. During the sample time, the sampling capacitance,  $C_{s\text{amp}}$  (3 pF typ), can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within  $t_S$ . After the end of the sample time  $t_S$ , changes of the analog input voltage have no effect on the conversion result.

**Figure 44. Typical application with ADC**

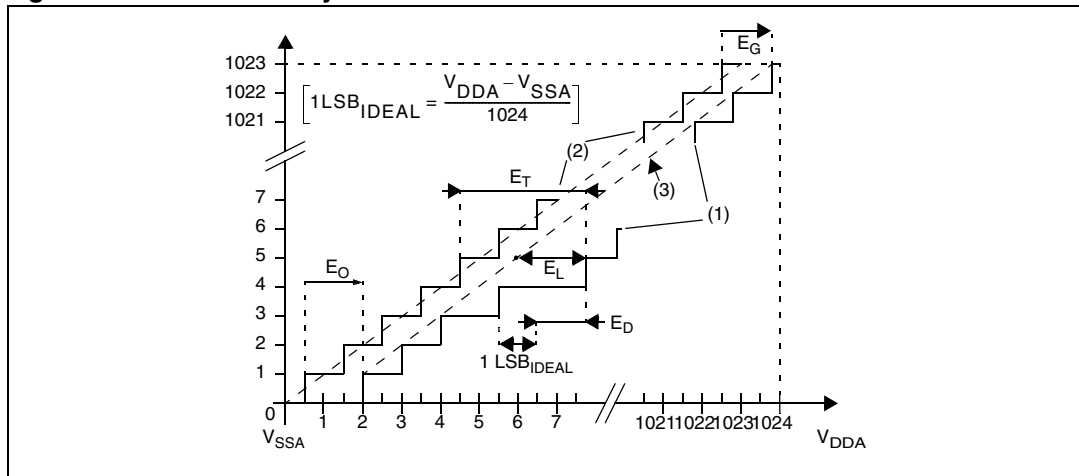

1. Legend:  $R_{AIN}$  = external resistance,  $C_{AIN}$  = capacitors,  $C_{s\text{amp}}$  = internal sample and hold capacitor.

**Table 57. ADC accuracy for  $V_{DDA} = 5\text{ V}$**

Symbol	Parameter	Conditions	Typ	Max <sup>(1)</sup>	Unit
$ E_T $	Total unadjusted error <sup>(2)</sup>	$f_{ADC} = 2\text{ MHz}$	1.4	3 <sup>(3)</sup>	LSB
$ E_O $	Offset error <sup>(2)</sup>		0.8	3	
$ E_G $	Gain error <sup>(2)</sup>		0.1	2	
$ E_D $	Differential linearity error <sup>(2)</sup>		0.9	1	
$ E_L $	Integral linearity error <sup>(2)</sup>		0.7	1.5	
$ E_T $	Total unadjusted error <sup>(2)</sup>	$f_{ADC} = 4\text{ MHz}$	1.9 <sup>(4)</sup>	4 <sup>(4)</sup>	
$ E_O $	Offset error <sup>(2)</sup>		1.3 <sup>(4)</sup>	4 <sup>(4)</sup>	
$ E_G $	Gain error <sup>(2)</sup>		0.6 <sup>(4)</sup>	3 <sup>(4)</sup>	
$ E_D $	Differential linearity error <sup>(2)</sup>		1.5 <sup>(4)</sup>	2 <sup>(4)</sup>	
$ E_L $	Integral linearity error <sup>(2)</sup>		1.2 <sup>(4)</sup>	1.5 <sup>(4)</sup>	

1. Max value is based on characterization, not tested in production.
2. ADC accuracy vs. injection current: Any positive or negative injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 10.3.6](#) does not affect the ADC accuracy.
3. TUE 2LSB can be reached on specific saletypes in the whole temperature range.
4. Target values.

**Figure 45. ADC accuracy characteristics**

1. Example of an actual transfer curve
  2. The ideal transfer curve
  3. End point correlation line
- $E_T$  = Total unadjusted error: Maximum deviation between the actual and the ideal transfer curves.  
 $E_O$  = Offset error: Deviation between the first actual transition and the first ideal one.  
 $E_G$  = Gain error: Deviation between the last ideal transition and the last actual one.  
 $E_D$  = Differential linearity error: Maximum deviation between actual steps and the ideal one.  
 $E_L$  = Integral linearity error: Maximum deviation between any actual transition and the end point correlation line.

### 10.3.12 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

#### Functional EMS (electromagnetic susceptibility)

While executing a simple application (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 1000-4-2 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 1000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers...)

#### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be recovered by applying a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

**Table 58. EMS data**

Symbol	Parameter	Conditions	Level/class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = 25\text{ }^\circ\text{C}$ , $f_{MASTER} = 16\text{ MHz}$ (HSI clock), Conforms to IEC 1000-4-2	3B
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = 25\text{ }^\circ\text{C}$ , $f_{MASTER} = 16\text{ MHz}$ (HSI clock), Conforms to IEC 1000-4-4	4A

**Electromagnetic interference (EMI)**

Emission tests conform to the SAE J 1752/3 standard for test software, board layout and pin loading.

**Table 59. EMI data**

Symbol	Parameter	Conditions					Unit
		General conditions	Monitored frequency band	Max f <sub>CPU</sub> <sup>(1)</sup>			
				8 MHz	16 MHz	24 MHz	
S <sub>EMI</sub>	Peak level	V <sub>DD</sub> = 5 V, T <sub>A</sub> = 25 °C, LQFP80 package conforming to SAE J 1752/3	0.1 MHz to 30 MHz	15	17	22	dBμV
			30 MHz to 130 MHz	18	22	16	
			130 MHz to 1 GHz	-1	3	5	
	SAE EMI level	—	2	2.5	2.5		

1. Data based on characterization results, not tested in production.

**Absolute maximum ratings (electrical sensitivity)**

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

**Electrostatic discharge (ESD)**

Electrostatic discharges (3 positive then 3 negative pulses separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts\*(n+1) supply pin). This test conforms to the JESD22-A114A/A115A standard. For more details, refer to the application note AN1181.

**Table 60. ESD absolute maximum ratings**

Symbol	Ratings	Conditions	Class	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = 25 °C, conforming to JESD22-A114	3A	4000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)	T <sub>A</sub> = 25 °C, conforming to JESD22-C101	3	500	

1. Data based on characterization results, not tested in production

**Static latch-up**

Two complementary static tests are required on 10 parts to assess the latch-up performance.

- A supply overvoltage (applied to each power supply pin) and
- A current injection (applied to each input, output and configurable I/O pin) are performed on each sample.

This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

**Table 61. Electrical sensitivities**

Symbol	Parameter	Conditions	Class <sup>(1)</sup>
LU	Static latch-up class	T <sub>A</sub> = 25 °C	A
		T <sub>A</sub> = 85 °C	
		T <sub>A</sub> = 125 °C	
		T <sub>A</sub> = 145 °C	

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).

## 10.4 Thermal characteristics

In case the maximum chip junction temperature ( $T_{Jmax}$ ) specified in [Table 37: General operating conditions on page 67](#) is exceeded, the functionality of the device cannot be guaranteed.

$T_{Jmax}$ , in degrees Celsius, may be calculated using the following equation:

### Equation 3

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

where:

$T_{Amax}$  is the maximum ambient temperature in °C

$\Theta_{JA}$  is the package junction-to-ambient thermal resistance in °C/W

$P_{Dmax}$  is the sum of  $P_{INTmax}$  and  $P_{I/Omax}$  ( $P_{Dmax} = P_{INTmax} + P_{I/Omax}$ )

$P_{INTmax}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/Omax}$  represents the maximum power dissipation on output pins

where:

### Equation 4

$$P_{I/Omax} = \Sigma (V_{OL} * I_{OL}) + \Sigma ((V_{DD} - V_{OH}) * I_{OH})$$

taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low- and high-level in the application.

**Table 62. Thermal characteristics<sup>(1)</sup>**

Symbol	Parameter	Value	Unit
$\Theta_{JA}$	Thermal resistance junction-ambient LQFP 80 - 14 x 14 mm	38	°C/W
$\Theta_{JA}$	Thermal resistance junction-ambient LQFP 64 - 10 x 10 mm	46	°C/W
$\Theta_{JA}$	Thermal resistance junction-ambient LQFP 48 - 7 x 7 mm	57	°C/W
$\Theta_{JA}$	Thermal resistance junction-ambient LQFP 32 - 7 x 7 mm	59	°C/W

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

### 10.4.1 Reference document

JESD51-2 integrated circuits thermal test method environment conditions - natural convection (still air). Available from [www.jedec.org](http://www.jedec.org).

### 10.4.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the order code (see [Figure 50: Ordering information scheme\(1\) on page 102](#)).

The following example shows how to calculate the temperature range needed for a given application.

Assuming the following application conditions:

- Maximum ambient temperature  $T_{Amax} = 82\text{ °C}$  (measured according to JESD51-2)
- $I_{DDmax} = 8\text{ mA}$
- $V_{DD} = 5\text{ V}$
- maximum 20 I/Os used at the same time in output at low-level with  $I_{OL} = 8\text{ mA}$
- $V_{OL} = 0.4\text{ V}$

#### Equation 5

$$P_{INTmax} = 8\text{ mA} \times 5\text{ V} = 400\text{ mW}$$

#### Equation 6

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} = 64\text{ mW}$$

This gives:

$$P_{INTmax} = 400\text{ mW} \text{ and } P_{IOmax} = 64\text{ mW}$$

#### Equation 7

$$P_{Dmax} = 400\text{ mW} + 64\text{ mW}$$

Thus:

$$P_{Dmax} = 464\text{ mW}$$

Using the values obtained in [Table 62: Thermal characteristics on page 95](#)  $T_{Jmax}$  is calculated as follows:

$$\text{For LQFP64 } 46\text{ °C/W}$$

#### Equation 8

$$T_{jmax} = 82\text{ °C} + (46\text{ °C/W} \times 464\text{ mW}) = 82\text{ °C} + 21\text{ °C} = 103\text{ °C}$$

This is within the range of the suffix B version parts ( $-40\text{ °C} < T_j < 105\text{ °C}$ ).

Parts must be ordered at least with the temperature range suffix B.

## 11 Package characteristics

### 11.1 ECOPACK®

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

## 11.2 Package mechanical data

# 12 Ordering information

Figure 50. Ordering information scheme<sup>(1)</sup>

1. Customer specific FASTROM code or custom device configuration. This field shows 'SSS' if the device contains a super set silicon, usually equipped with bigger memory and more I/Os. This silicon is supposed to be replaced later by the target silicon.
2. For a list of available options (e.g. memory size, package) and orderable part numbers or for further information on any aspect of this device, please go to [www.st.com](http://www.st.com) or contact the ST Sales Office nearest to you.

## 13 Known limitations

### 13.1 STM8A core

#### 13.1.1 Wait for event instruction (WFE) not available

##### Description

The WFE instruction is not implemented in the devices covered by this datasheet. This instruction is used to synchronize the device with external computing resources. For further details on this instruction, refer to the STM8 CPU programming manual (PM0044) on [www.st.com](http://www.st.com).

##### Workaround

None.

#### 13.1.2 JRIL and JRIH instructions not available

##### Description

JRIL (jump if port INT pin = 0) and JRIH (jump if port INT pin = 1) are not supported by the devices covered by this datasheet. These instructions perform conditional jumps: JRIL and JRIH jump if one of the external interrupt lines is low and high, respectively.

In the devices covered by this datasheet, JRIL is equivalent to an unconditional jump and JRIH is equivalent to NOP. For further details on these instructions, refer to the STM8 CPU programming manual (PM0044) on [www.st.com](http://www.st.com).

##### Workaround

None.

#### 13.1.3 CPU not returning to Halt mode when the AL bit is set

##### Description

When the AL bit of the CFG\_GCR register is set, the CPU does not return to Halt mode after exiting an interrupt service routine (ISR). It returns to the main program and executes the next instruction after the HALT instruction.

##### Workaround

None.

#### 13.1.4 Main program not resuming after ISR has reset the AL bit

##### Description

If the CPU is in wait for interrupt state and the AL bit is set, the CPU returns to wait for interrupt state after executing an ISR. To continue executing the main program, the AL bit must be reset by the ISR. When AL is reset just before exiting the ISR, the CPU may remain stalled.

**Workaround**

Reset the AL bit at least two instructions before the IRET instruction.

## 13.2 I<sup>2</sup>C interface

### 13.2.1 Misplaced NACK bit when receiving 2 bytes in master mode

**Description**

When receiving two bytes in master mode, the usual sequence is the following:

1. Set POS and ACK bits of the I2C\_CR2 register to 1.
2. Wait for ADDR event (address sent bit in I2C\_SR1 register). When ADDR is set to 1, program ACK to 0 and clear ADDR.
3. Wait for BTF event (byte transfer finished bit in I2C\_SR1 register). When BTF is set to 1, program the STOP bit to 1 in the I2C\_CR2 register, and read the 2 received bytes.

The NACK bit may be sent erroneously after the first byte.

**Workaround**

Use a different software sequence to clear ADDR and ACK bits:

1. Wait till ADDR flag is set.
2. Mask interrupts.
3. Clear ADDR bit.
4. Clear ACK bit.
5. Re-enable interrupts.

As the TLI interrupt is not maskable, this software workaround can not be implemented in applications using the TLI interrupt.

### 13.2.2 Data register corrupted

**Description**

The content of the shift register may be shifted to the left by 1 bit and the second read operation will return an incorrect value when the following conditions are met:

- BTF bit (last data received) set to 1
- Software sequence (SET STOP, READ N-1, READ N) delayed (for instance by an interrupt)
- N-1 byte not read before the next SCL rising edge.

**Workaround**

Mask all active interrupts between the SET STOP and the READ N-1 instructions. As TLI is not maskable, this software workaround can not be implemented in applications using the TLI interrupt.

### 13.2.3 Delay in STOP bit programming leading to reception of supplementary byte

#### Description

When receiving one byte in master mode, the STOP bit in the I2C\_CR2 register is programmed just after ADDR bit is cleared in order to generate a STOP condition after the reception of the byte. If the programming of the STOP bit is delayed after the end of the first byte reception, the master may receive another byte before the STOP condition is generated and a wrong data will be received.

#### Workaround

Mask interrupts while clearing the ADDR bit and programming the STOP bit. As TLI is not maskable, this software workaround can not be implemented in applications using the TLI interrupt.

### 13.2.4 START condition badly generated after misplaced STOP

#### Description

When the START bit is set in the I2C\_CR2 register and a misplaced STOP occurs on the bus thus leading to a bus error, the START condition on the bus may be badly generated by the I<sup>2</sup>C peripheral (glitch on SDA resulting in SDA and SCL tied low simultaneously).

#### Workaround

When a bus error is detected (through a flag and/or interrupt), check if a START condition was requested through the I2C\_CR2 register. If so, a STOP condition should be generated followed by a new START condition. This does not avoid the badly generated START condition, but allows to resynchronize the network on the new START condition.

## 13.3 USART Interface

### Parity error flag (PE) not correctly set when overrun condition occurs

#### Description

If an overrun condition occurs, the parity error flag (PE) of the UART\_SR register is not set for the frame which caused the overrun condition. The PE flag represents the status of the last correctly received frame.

#### Workaround

None.

## 13.4 LINUART interface

### 13.4.1 Framing error with data byte 0x00

#### Description

If the LINUART interface is configured in LIN slave mode, and the active mode with break detection length is set to 11 (LBDL bit of UART\_CR4 register set to 1), FE and RXNE flags are not set when receiving a 0x00 data byte with a framing error, followed by a recessive state. This occurs only if the dominant state length is between 9.56 and 10.56 times the baud rate.

#### Workaround

The LIN software driver can handle this exceptional case by implementing frame timeouts to comply with the LIN standard. This method has been implemented in ST LIN 2.1 driver package which passed the LIN compliance tests.

### 13.4.2 Framing error when receiving an identifier (ID)

#### Description

If an ID framing error occurs when the LINUART is in active mode, both LHE and LHDF flags are set at the end of the LIN header with ID framing error.

#### Workaround

The LIN software driver can handle this case by checking both LHE and LHDF flags upon header reception.

### 13.4.3 Parity error when receiving an identifier (ID)

#### Description

If an ID parity error occurs, the LINUART wakes up from mute mode and both LHE and LHDF are set at the end of the LIN header with parity error. The PE flag is also set.

#### Workaround

The LIN software driver can handle this case by checking all the flags upon header reception.

### 13.4.4 OR flag not correctly set in LIN master mode

#### Description

When the LINUART operates in master mode, the OR flag is not set if an overrun condition occurs.

#### Workaround

The LIN software driver can detect this case through a LIN protocol error.

### 13.4.5 LIN header error when automatic resynchronization is enabled

#### Description

If the LINUART is configured in LIN slave mode (LSLV bit set in LINUART\_CR6 register) and the automatic resynchronization is enabled (LASE bit set in LINUART\_CR6), the LHE flag may be set instead of LHDF flag when receiving a valid header.

#### Workaround

None.

## 13.5 Clock controller

### 13.5.1 HSI RC oscillator cannot be switched off in run mode

#### Description

The internal 16 MHz RC oscillator cannot be switched off in run mode, even if the HSIEN bit is programmed to 0.

#### Workaround

None.

## 13.6 SPI Interface

### 13.6.1 Last bit too short if SPI is disabled during communication

#### Description

When the SPI interface operates in master mode and the baud rate generator prescaler is equal to 2, the SPI is disabled during ongoing communications, and the data and clock output signals are switched off at the last strobing edge of the SPI clock.

As a consequence the length of the last bit is out of range and its reception on the bus is not ensured.

#### Workaround

Check if a communication is ongoing before disabling the SPI interface. This can be done by monitoring the BSY bit in the SPI\_SR register.

## 13.7 beCAN interface

### 13.7.1 beCAN transmission error when sleep mode is entered during transmission

#### Description

If sleep mode entry is requested while a transmission is ongoing or a transmission request is pending, the beCAN T<sub>x</sub> pin will have a spurious behavior incompliant with the CAN protocol.

No error frame will be sent and the device will enter sleep mode.

#### Workaround

Ensure that no transmission is ongoing and that no transmission request is pending before putting the beCAN in sleep mode. This can be done by checking the beCAN control and status registers before entering sleep mode. Refer to section 24.4.3 Sleep mode (low power) of the RM0009 reference manual.

### 13.7.2 beCAN woken up from sleep mode with automatic wakeup interrupt

#### Description

Waking up the beCAN from sleep mode using the automatic wakeup interrupt triggers an interrupt on each CAN Rx falling edge until the bus is idle.

#### Workaround

To have a wakeup interrupt triggered only on the first falling edge of the CAN Rx pin, perform the following actions:

1. Disable the automatic wakeup interrupt.
2. Clear the WKUI flag.
3. Disable the sleep mode in the ISR.

### 13.7.3 beCAN time triggered communication mode not supported

#### Description

The time triggered communication mode described in section 24.4.4 of the STM8A reference manual (RM0009) is not supported.

TTCM bit must be kept at 0 in the CAN\_MCR register (time triggered communication mode disabled), and TGT bit in CAN\_MDLCR must be initialized to 0 (CAN\_MTSRH and CAN\_MTSRL registers not sent).

#### Workaround

None.

### 13.7.4 be CAN read error in slow mode

#### Description

The read byte may be corrupted when the CPU is in slow mode and a FIFO read operation is performed while a message transmission is ongoing. This happens because the transmission mailboxes and the receive FIFOs share the same address/data lines for read and write operations.

#### Workaround

To prevent this problem from occurring, the CPU clock must be the master clock (CLK\_CKDIVR[2:0] = 000b) when the user application starts reading the FIFO (CPU clock divider changed to /1). After the FIFO read operation is complete, the CPU clock divider (slow mode) could be applied again.

## 14 STM8 development tools

Development tools for the STM8A microcontrollers include the

- STice emulation system offering tracing and code profiling
- STVD high-level language debugger including assembler and visual development environment - seamless integration of third party C compilers
- STVP Flash programming software

In addition, the STM8A comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

### 14.1 Emulation and in-circuit debugging tools

The STM8 tool line includes the STice emulation system offering a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8A application development is supported by a low-cost in-circuit debugger/programmer.

The STice is the fourth generation of full-featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including tracing, profiling and code coverage analysis to help detect execution bottlenecks and dead code.

In addition, STice offers in-circuit debugging and programming of STM8A microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STice is based on a modular design that allows you to order exactly what you need to meet your development requirements and to adapt your emulation system to support existing and future ST microcontrollers.

#### 14.1.1 STice key features

- Program and data trace recording up to 128 K records
- Advanced breakpoints with up to 4 levels of conditions
- Data breakpoints
- Real-time read/write of all device resources during emulation
- Occurrence and time profiling and code coverage analysis (new features)
- In-circuit debugging/programming via SWIM protocol
- 8-bit probe analyzer
- 1 input and 2 output triggers
- USB 2.0 high-speed interface to host PC
- Power supply follower managing application voltages between 1.62 to 5.5 V
- Modularity that allows you to specify the components you need to meet your development requirements and adapt to future requirements
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.

## 14.2 Software tools

STM8 development tools are supported by a complete, free software package from STMicroelectronics that includes ST visual develop (STVD) IDE and the ST visual programmer (STVP) software interface. STVD provides seamless integration of the Cosmic C compiler for STM8, which is available in a free version that outputs up to 16 Kbytes of code.

### 14.2.1 STM8 toolset

The STM8 toolset with STVD integrated development environment and STVP programming software is available for free download at [www.st.com/mcu](http://www.st.com/mcu). This package includes:

#### ST visual develop

Full-featured integrated development environment from STMicroelectronics, featuring:

- Seamless integration of C and ASM toolsets
- Full-featured debugger
- Project management
- Syntax highlighting editor
- Integrated programming interface
- Support of advanced emulation features for STIce such as code profiling and coverage

#### ST visual programmer (STVP)

Easy-to-use, unlimited graphical interface allowing read, write and verification of the STM8A microcontroller's Flash memory. STVP also offers project mode for saving programming configurations and automating programming sequences.

### 14.2.2 C and assembly toolchains

Control of C and assembly toolchains is seamlessly integrated into the STVD integrated development environment, making it possible to configure and control the building of your application directly from an easy-to-use graphical interface. Available toolchains include:

#### C compiler for STM8

Available in a free version that outputs up to 16 Kbytes of code. For more information, see [www.cosmic-software.com](http://www.cosmic-software.com), [www.raisonance.com](http://www.raisonance.com)

#### STM8 assembler linker

Free assembly toolchain included in the STM8 toolset, which allows you to assemble and link your application source code.

## 14.3 Programming tools

During the development cycle, STice provides in-circuit programming of the STM8A Flash microcontroller on your application board via the SWIM protocol. Additional tools are to include a low-cost in-circuit programmer as well as ST socket boards, which provide dedicated programming platforms with sockets for programming your STM8A.

For production environments, programmers will include a complete range of gang and automated programming solutions from third-party tool developers already supplying programmers for the STM8 family.

# 15 Revision history

**Table 67. Document revision history**

Date	Revision	Changes
31-Jan-2008	Rev 1	Initial release
22-Aug-2008	Rev 2	<p>Added 'H' products to the datasheet (Flash no EEPROM).  <i>Features on page 1</i>: Updated <i>Memories, Reset and supply management, Communication interfaces</i> and <i>I/Os</i>; reduced wakeup pins by 1.  <i>Table 1</i>: Removed STM8AF6168, STM8AF6148, STM8AF6166, STM8AF6146, STM8AF5168, STM8AF5186, STM8AF5176, and STM8AF5166.  <i>Section 1, Section 5, Section 6.2, Table 33, and Section 9</i>: Updated reference documentation: RM0009, PM0047, and UM0470.  <i>Section 2</i>: Added information about peak performance.  <i>Section 3</i>: Removed <i>STM8A common features</i> table.  <i>Table 2</i>: Removed STM8AF5186T, STM8AF5176T, STM8AF5168T, and STM8AF5166T.  <i>Table 3</i>: Removed STM8AF6168T, STM8AF6166T, STM8AF6148T, and STM8AF6146T.  <i>Section 5</i>: Made minor content changes and improved readability and layout.  <i>Section 5.5.3</i>: Major modification, TMU included.  <i>Section 5.5.2</i>: User trimming updated.  <i>Section 5.5.3</i>: LSI as CPU clock added.  <i>Section 5.5.4, Section 5.5.5</i>: Maximum frequency conditional 32 Kbyte/128 Kbyte.  <i>Section 5.8</i>: Scan for 128 Kbyte removed.  <i>Section 5.9, Section 5.9.3</i>: SPI 10 Mb/s.  <i>Figure 3, Figure 4, and Figure 5</i>: Amended footnote 1.  <i>Table 6</i>: HS output changed from 20 mA to 8 mA.  <i>Section 7</i>: Corrected <i>Figure 7: Register and memory map</i>; removed address list; added <i>Table 8</i>.  <i>Section 10.3.2</i> Note on typical/WC values added.  <i>Table 14</i>: Replaced the source blocks 'simple USART', 'very low-end timer (timer 4)', and 'EEPROM' with 'LINUART', 'timer4' and 'reserved' respectively, added TMU registers.  <i>Table 32</i>: Updated OPT6 and NOPT6, added OPT7 to 17 (TMU, BL)  <i>Table 33</i>: Updated OPT1 UBC[7:0], OPT4 CKAWUSEL, OPT4 PRSC [1:0], and OPT6, added OPT7 to 16 (TMU).  <i>Table 35</i>: Amended footnotes.  <i>Table 37</i>: Added parameter 'voltage and current operating conditions'.  <i>Table 38</i>: Amended footnotes.  <i>Table 39</i>: Replaced.  <i>Table 40</i>: Amended maximum data and footnotes.  <i>Table 21</i>: Replaced.  <i>Table 22</i>: Added and amended I<sub>DD(RUN)</sub> data; amended I<sub>DD(WFI)</sub> data; amended footnotes.  <i>Table 43</i>: Filled in, amended maximum data and footnotes.  <i>Figure 14 to Figure 19</i>: info on peripheral activity added.  <i>Table 44</i>: Modified f<sub>HSE_ext</sub> data and added V<sub>HSEdhl</sub> data.</p>
