## FUNCTIONAL DESCRIPTIONS

## 1. Pulse Swallow Function

The divide ratio is set using the following equation.
fvco $=[(M \times N)+A] \times$ fosc $\div R$
fvco : Output frequency of external voltage controlled oscillator (VCO)
M : Preset modulus of external dual modulus prescaler (64 or 128)
N : Preset divide ratio of binary 11-bit programmable counter (16 to 2047)
$A$ : Preset divide ratio of binary 7 -bit swallow counter ( $0 \leq A \leq 127, A<N$ )
fosc : Output frequency of the external reference frequency oscillator
R : Preset divide ratio of binary 14-bit programmable reference counter (8 to 16383)

## 2. Serial Data Input

Serial data input is achieved by three inputs, such as Data pin, Clock pin and LE pin. Serial data input controls $15-$ bit programmable reference divider and 18 -bit programmable divider, respectively.

Binary serial data is input to Data pin.
On rising edge of clock shifts one bit of serial data into the internal shift registers and when load enable pin is high level or open, stored data is transferred into latch depending upon the control bit.
Control data " H " data is transferred into 15 -bit latch.
Control data "L" data is transferred into 18-bit latch.

3. Serial Data Input Timing

* : Paranthesis data is used for setting divide ratio of programmable reference divider. On rising edge of clock shifts one bit of data in the shift register.

## 4. Phase Characteristics

FC pin is provided to change phase characteristics of phase comparator. Characteristics of internal charge pump output level (Do), phase comparator output level ( $\phi \mathrm{R}, \phi \mathrm{\phi}$ ) are reversed depending upon FC pin input level. Also, monitor pin (fout) output level of phase comparator is controlled by FC pin input level. The relation between outputs ( $\mathrm{Do}, \phi \mathrm{R}, \phi \mathrm{P}$ ) and FC input level are shown below.

|  | FC : "H" or open |  |  |  | FC: "L" |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Do | ¢R | ${ }_{\phi} \mathbf{P}$ | fout | Do | ¢R | ¢P | fout |
| fr $>$ fp | H | L | L | (fr) | L | H | Z | (fp) |
| $\mathrm{fr}=\mathrm{fp}$ | Z | L | Z | (fr) | Z | L | Z | (fp) |
| $\mathrm{fr}<\mathrm{fp}$ | L | H | Z | (fr) | H | L | L | (fp) |

Note: Z = (High impedance)
Depending upon VCO characteristics, FC pin should be set accordingly:

- When VCO characteristics are like (1), FC should be set High or open circuit; When VCO characteristics are like (2), FC should be set Low.

Phase comparator output waveforms are shown below.

Notes: Phase difference detection range: $-2 \pi$ to $+2 \pi$
Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band. When fr>fp or fr<fp, spike might not appear depending upon charge rump characteristics.

## 5. Analog Switch

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON, internal charge pump output (Do) is connected to BiSW pin. When the analog switch is OFF, BiSW pin is set to high-impedance state.

| LE | Analog Switch |
| :--- | :---: |
| H (Changing the divide ratio of internal prescaler) | ON |
| L (Normal operationg mode) | OFF |

When an analog switch is inserted between LP1 and LP2, faster lock up times is achieved to reduce LPF time constant during PLL channal switching.
